5.9.3.1 on_timeout()	26
5.9.3.2 run()	26
5.10 DriveStopCommand Class Reference	26
5.10.1 Detailed Description	27
5.10.2 Constructor & Destructor Documentation	27
5.10.2.1 DriveStopCommand()	27
5.10.3 Member Function Documentation	27
5.10.3.1 on_timeout()	27
5.10.3.2 run()	28

5.11 DriveToPointCommand Class Reference	28
5.11.1 Detailed Description	29
5.11.2 Constructor & Destructor Documentation	29
5.11.2.1 DriveToPointCommand() [1/2]	29
5.11.2.2 DriveToPointCommand() [2/2]	29
5.11.3 Member Function Documentation	30
5.11.3.1 run()	30
5.12 AutoChooser::entry_t Struct Reference	30
5.12.1 Detailed Description	30
5.12.2 Member Data Documentation	31
5.12.2.1 height	31
5.12.2.2 name	31
5.12.2.3 width	31
5.12.2.4 x	31
5.12.2.5 y	31
5.13 Feedback Class Reference	31
5.13.1 Detailed Description	32
5.13.2 Member Function Documentation	32
5.13.2.1 get()	32
5.13.2.2 init()	32
5.13.2.3 is_on_target()	33
5.13.2.4 set_limits()	33
5.13.2.5 update()	33
5.14 FeedForward Class Reference	34
5.14.1 Detailed Description	34
5.14.2 Constructor & Destructor Documentation	34
5.14.2.1 FeedForward()	34
5.14.3 Member Function Documentation	35
5.14.3.1 calculate()	35
5.15 FeedForward::ff_config_t Struct Reference	35
5.15.1 Detailed Description	35
5.15.2 Member Data Documentation	36
5.15.2.1 kA	36
5.15.2.2 kG	36
5.15.2.3 kS	36
5.15.2.4 kV	36
5.16 Flywheel Class Reference	36
5.16.1 Detailed Description	37
5.16.2 Constructor & Destructor Documentation	37
5.16.2.1 Flywheel() [1/4]	37
5.16.2.2 Flywheel() [2/4]	38
5.16.2.3 Flywheel() [3/4]	38

5.16.2.4 Flywheel() [4 / 4]	38
5.16.3 Member Function Documentation	39
5.16.3.1 getDesiredRPM()	39
5.16.3.2 getFeedforwardValue()	39
5.16.3.3 getMotors()	39
5.16.3.4 getPID()	39
5.16.3.5 getPIDValue()	40
5.16.3.6 getRPM()	40
5.16.3.7 getTBHGain()	40
5.16.3.8 isTaskRunning()	40
5.16.3.9 measureRPM()	40
5.16.3.10 setPIDTarget()	40
5.16.3.11 spin_manual()	41
5.16.3.12 spin_raw()	41
5.16.3.13 spinRPM()	41
5.16.3.14 stop()	42
5.16.3.15 stopMotors()	42
5.16.3.16 stopNonTasks()	42
5.16.3.17 updatePID()	42
5.17 FlywheelStopCommand Class Reference	42
5.17.1 Detailed Description	43
5.17.2 Constructor & Destructor Documentation	43
5.17.2.1 FlywheelStopCommand()	43
5.17.3 Member Function Documentation	43
5.17.3.1 run()	43
5.18 FlywheelStopMotorsCommand Class Reference	44
5.18.1 Detailed Description	44
5.18.2 Constructor & Destructor Documentation	44
5.18.2.1 FlywheelStopMotorsCommand()	44
5.18.3 Member Function Documentation	45
5.18.3.1 run()	45
5.19 FlywheelStopNonTasksCommand Class Reference	45
5.19.1 Detailed Description	46
5.20 FunctionCommand Class Reference	46
5.20.1 Detailed Description	47
5.20.2 Member Function Documentation	47
5.20.2.1 run()	47
5.21 FunctionCondition Class Reference	47
5.21.1 Detailed Description	47
5.21.2 Member Function Documentation	48
5.21.2.1 test()	48
5.22 GenericAuto Class Reference	48

5.22.1 Detailed Description	48
5.22.2 Member Function Documentation	48
5.22.2.1 add()	48
5.22.2.2 add_async()	48
5.22.2.3 add_delay()	49
5.22.2.4 run()	49
5.23 GraphDrawer Class Reference	49
5.23.1 Constructor & Destructor Documentation	50
5.23.1.1 GraphDrawer()	50
5.23.2 Member Function Documentation	50
5.23.2.1 add_sample()	50
5.23.2.2 draw()	51
5.24 PurePursuit::hermite_point Struct Reference	51
5.24.1 Detailed Description	51
5.25 IfTimePassed Class Reference	52
5.25.1 Detailed Description	52
5.25.2 Member Function Documentation	52
5.25.2.1 test()	52
5.26 InOrder Class Reference	52
5.26.1 Detailed Description	53
5.26.2 Member Function Documentation	53
5.26.2.1 on_timeout()	53
5.26.2.2 run()	53
5.27 Lift< T > Class Template Reference	54
5.27.1 Detailed Description	54
5.27.2 Constructor & Destructor Documentation	54
5.27.2.1 Lift()	54
5.27.3 Member Function Documentation	55
5.27.3.1 control_continuous()	55
5.27.3.2 control_manual()	55
5.27.3.3 control_setpoints()	55
5.27.3.4 get_async()	56
5.27.3.5 get_setpoint()	56
5.27.3.6 hold()	56
5.27.3.7 home()	56
5.27.3.8 set_async()	56
5.27.3.9 set_position()	57
5.27.3.10 set_sensor_function()	57
5.27.3.11 set_sensor_reset()	57
5.27.3.12 set_setpoint()	57
5.28 Lift< T >::lift_cfg_t Struct Reference	58
5.28.1 Detailed Description	58

5.29 Logger Class Reference	58
5.29.1 Detailed Description	59
5.29.2 Constructor & Destructor Documentation	59
5.29.2.1 Logger()	59
5.29.3 Member Function Documentation	60
5.29.3.1 Log() [1/2]	60
5.29.3.2 Log() [2/2]	60
5.29.3.3 Logf() [1/2]	60
5.29.3.4 Logf() [2/2]	60
5.29.3.5 LogIn() [1/2]	61
5.29.3.6 LogIn() [2/2]	61
5.30 MotionController::m_profile_cfg_t Struct Reference	61
5.30.1 Detailed Description	62
5.31 MecanumDrive Class Reference	62
5.31.1 Detailed Description	62
5.31.2 Constructor & Destructor Documentation	62
5.31.2.1 MecanumDrive()	62
5.31.3 Member Function Documentation	63
5.31.3.1 auto_drive()	63
5.31.3.2 auto_turn()	63
5.31.3.3 drive()	64
5.31.3.4 drive_raw()	65
5.32 MecanumDrive::mecanumdrive_config_t Struct Reference	65
5.32.1 Detailed Description	65
5.33 motion_t Struct Reference	65
5.33.1 Detailed Description	66
5.34 MotionController Class Reference	66
5.34.1 Detailed Description	67
5.34.2 Constructor & Destructor Documentation	67
5.34.2.1 MotionController()	67
5.34.3 Member Function Documentation	68
5.34.3.1 get()	68
5.34.3.2 get_motion()	68
5.34.3.3 init()	68
5.34.3.4 is_on_target()	68
5.34.3.5 set_limits()	69
5.34.3.6 tune_feedforward()	69
5.34.3.7 update()	70
5.35 MovingAverage Class Reference	70
5.35.1 Detailed Description	70
5.35.2 Constructor & Destructor Documentation	71
5.35.2.1 MovingAverage() [1/2]	71

5.35.2.2 MovingAverage() [2/2]	71
5.35.3 Member Function Documentation	71
5.35.3.1 add_entry()	71
5.35.3.2 get_average()	71
5.35.3.3 get_size()	72
5.36 Odometry3Wheel Class Reference	72
5.36.1 Detailed Description	73
5.36.2 Constructor & Destructor Documentation	74
5.36.2.1 Odometry3Wheel()	74
5.36.3 Member Function Documentation	74
5.36.3.1 tune()	74
5.36.3.2 update()	74
5.37 Odometry3Wheel::odometry3wheel_cfg_t Struct Reference	75
5.37.1 Detailed Description	75
5.37.2 Member Data Documentation	75
5.37.2.1 off_axis_center_dist	75
5.37.2.2 wheel_diam	75
5.37.2.3 wheelbase_dist	75
5.38 OdometryBase Class Reference	76
5.38.1 Detailed Description	77
5.38.2 Constructor & Destructor Documentation	77
5.38.2.1 OdometryBase()	77
5.38.3 Member Function Documentation	77
5.38.3.1 background_task()	77
5.38.3.2 end_async()	78
5.38.3.3 get_accel()	78
5.38.3.4 get_angular_accel_deg()	78
5.38.3.5 get_angular_speed_deg()	78
5.38.3.6 get_position()	78
5.38.3.7 get_speed()	79
5.38.3.8 pos_diff()	79
5.38.3.9 rot_diff()	79

Chapter 1

Core

This is the host repository for the custom VEX libraries used by the RIT VEXU team

Automatically updated documentation is available at [here](#). There is also a downloadable [reference manual](#).

1.1 Getting Started

In order to simply use this repo, you can either clone it into your VEXcode project folder, or download the .zip and place it into a core/ subfolder. Then follow the instructions for setting up compilation at [Wiki/BuildSystem](#)

If you wish to contribute, follow the instructions at [Wiki/ProjectSetup](#)

1.2 Features

Here is the current feature list this repo provides:

Subsystems (See [Wiki/Subsystems](#)):

- Tank drivetrain (user control / autonomous)
- Mecanum drivetrain (user control / autonomous)
- Odometry
- [Flywheel](#)
- [Lift](#)
- Custom encoders

Utilities (See [Wiki/Utilites](#)):

- [PID](#) controller
- [FeedForward](#) controller
- Trapezoidal motion profile controller
- Pure Pursuit
- Generic auto program builder
- Auto program UI selector
- Mathematical classes ([Vector2D](#), Moving Average)

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

AutoChooser	10
AutoCommand	13
Async	9
Branch	15
DelayCommand	23
DriveForwardCommand	24
DriveStopCommand	26
DriveToPointCommand	28
FlywheelStopCommand	42
FlywheelStopMotorsCommand	44
FlywheelStopNonTasksCommand	45
FunctionCommand	46
InOrder	52
OdomSetPosition	85
Parallel	87
PurePursuitCommand	99
SpinRPMCommand	107
TurnDegreesCommand	121
TurnToHeadingCommand	123
WaitUntilCondition	128
WaitUntilUpToSpeedCommand	129
CommandController	16
Condition	20
FunctionCondition	47
IfTimePassed	52
vex::encoder	
CustomEncoder	20
AutoChooser::entry_t	30
Feedback	31
MotionController	66
PID	89
PIDFF	94
FeedForward	34
FeedForward::ff_config_t	35

Flywheel	36
GenericAuto	48
GraphDrawer	49
PurePursuit::hermite_point	51
Lift< T >	54
Lift< T >::lift_cfg_t	58
Logger	58
MotionController::m_profile_cfg_t	61
MecanumDrive	62
MecanumDrive::mecanumdrive_config_t	65
motion_t	65
MovingAverage	70
Odometry3Wheel::odometry3wheel_cfg_t	75
OdometryBase	76
Odometry3Wheel	72
OdometryTank	82
parallel_runner_info	88
PID::pid_config_t	93
point_t	97
pose_t	98
robot_specs_t	101
Serializer	102
PurePursuit::spline	108
TankDrive	109
TrapezoidProfile	118
Vector2D	124

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Async	
Async runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT	9
AutoChooser	10
AutoCommand	13
Branch	
Branch chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO_CHOICE; any choice that is out of bounds set to NO_CHOICE	15
CommandController	16
Condition	20
CustomEncoder	20
DelayCommand	23
DriveForwardCommand	24
DriveStopCommand	26
DriveToPointCommand	28
AutoChooser::entry_t	30
Feedback	31
FeedForward	34
FeedForward::ff_config_t	35
Flywheel	36
FlywheelStopCommand	42
FlywheelStopMotorsCommand	44
FlywheelStopNonTasksCommand	45
FunctionCommand	46
FunctionCondition	
FunctionCondition is a quick and dirty Condition to wrap some expression that should be evaluated at runtime	47
GenericAuto	48
GraphDrawer	49
PurePursuit::hermite_point	51
IfTimePassed	
IfTimePassed tests based on time since the command controller was constructed. Returns true if elapsed time > time_s	52

InOrder	
InOrder runs its commands sequentially then continues. How to handle timeout in this case.	
Automatically set it to sum of commands timeouts?	52
Lift< T >	54
Lift< T >::lift_cfg_t	58
Logger	
Class to simplify writing to files	58
MotionController::m_profile_cfg_t	61
MecanumDrive	62
MecanumDrive::mecanumdrive_config_t	65
motion_t	65
MotionController	66
MovingAverage	70
Odometry3Wheel	72
Odometry3Wheel::odometry3wheel_cfg_t	75
OdometryBase	76
OdometryTank	82
OdomSetPosition	85
Parallel	
Parallel runs multiple commands in parallel and waits for all to finish before continuing. if none	
finish before this command's timeout, it will call on_timeout on all children continue	87
parallel_runner_info	88
PID	89
PID::pid_config_t	93
PIDFF	94
point_t	97
pose_t	98
PurePursuitCommand	99
robot_specs_t	101
Serializer	
Serializes Arbitrary data to a file on the SD Card	102
SpinRPMCommand	107
PurePursuit::spline	108
TankDrive	109
TrapezoidProfile	118
TurnDegreesCommand	121
TurnToHeadingCommand	123
Vector2D	124
WaitUntilCondition	
Waits until the condition is true	128
WaitUntilUpToSpeedCommand	129

Chapter 4

Chapter 5

Class Documentation

5.1 Async Class Reference

[Async](#) runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT.

```
#include <auto_command.h>
```

Inheritance diagram for Async:

Public Member Functions

- **Async** ([AutoCommand](#) *cmd)
- bool [run](#) () override

Public Member Functions inherited from [AutoCommand](#)

- virtual void [on_timeout](#) ()
- [AutoCommand](#) * **withTimeout** (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.1.1 Detailed Description

[Async](#) runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT.

5.1.2 Member Function Documentation

5.1.2.1 run()

```
bool Async::run ( ) [override], [virtual]
```

Executes the command Overridden by child classes

Returns

true when the command is finished, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/auto_command.h
- src/utils/command_structure/auto_command.cpp

5.2 AutoChooser Class Reference

```
#include <auto_chooser.h>
```

Classes

- struct [entry_t](#)

Public Member Functions

- [AutoChooser](#) (vex::brain &[brain](#))
- void [add](#) (std::string name)
- std::string [get_choice](#) ()

Protected Member Functions

- void [render](#) ([entry_t](#) *selected)

Protected Attributes

- std::string [choice](#)
- std::vector< [entry_t](#) > [list](#)
- vex::brain & [brain](#)

5.2.1 Detailed Description

Autochooser is a utility to make selecting robot autonomous programs easier source: RIT VexU Wiki During a season, we usually code between 4 and 6 autonomous programs. Most teams will change their entire robot program as a way of choosing autonomi but this may cause issues if you have an emergency patch to upload during a competition. This class was built as a way of using the robot screen to list autonomous programs, and the touchscreen to select them.

5.2.2 Constructor & Destructor Documentation

5.2.2.1 AutoChooser()

```
AutoChooser::AutoChooser (
    vex::brain & brain )
```

Initialize the auto-chooser. This class places a choice menu on the brain screen, so the driver can choose which autonomous to run.

Parameters

<i>brain</i>	the brain on which to draw the selection boxes
--------------	--

5.2.3 Member Function Documentation

5.2.3.1 add()

```
void AutoChooser::add (
    std::string name )
```

Add an auto path to the chooser

Parameters

<i>name</i>	The name of the path. This should be used as an human readable identifier to the auto path
-------------	--

Add a new autonomous option. There are 3 options per row.

5.2.3.2 get_choice()

```
std::string AutoChooser::get_choice ( )
```

Get the currently selected auto choice

Returns

the identifier to the auto path

Return the selected autonomous

5.2.3.3 render()

```
void AutoChooser::render (
    entry_t * selected ) [protected]
```

Place all the autonomous choices on the screen. If one is selected, change it's color

Parameters

<i>selected</i>	the choice that is currently selected
-----------------	---------------------------------------

5.2.4 Member Data Documentation

5.2.4.1 brain

```
vex::brain& AutoChooser::brain [protected]
```

the brain to show the choices on

5.2.4.2 choice

```
std::string AutoChooser::choice [protected]
```

the current choice of auto

5.2.4.3 list

```
std::vector<entry_t> AutoChooser::list [protected]
```

< a list of all possible auto choices

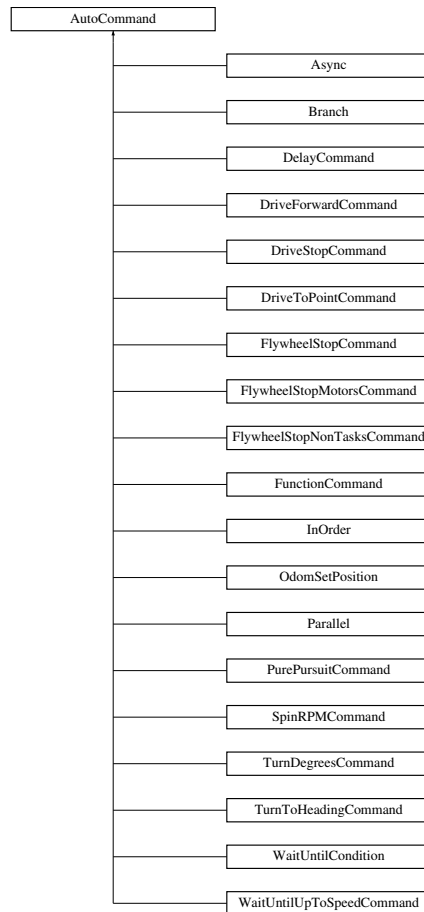

The documentation for this class was generated from the following files:

- include/utils/auto_chooser.h
- src/utils/auto_chooser.cpp

5.3 AutoCommand Class Reference

```
#include <auto_command.h>
```

Inheritance diagram for AutoCommand:

Public Member Functions

- virtual bool [run](#) ()
- virtual void [on_timeout](#) ()
- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Public Attributes

- double [timeout_seconds](#) = default_timeout

Static Public Attributes

- static constexpr double [default_timeout](#) = 10.0

5.3.1 Detailed Description

File: [auto_command.h](#) Desc: Interface for module-specific commands

5.3.2 Member Function Documentation

5.3.2.1 on_timeout()

```
virtual void AutoCommand::on_timeout ( ) [inline], [virtual]
```

What to do if we timeout instead of finishing. timeout is specified by the timeout seconds in the constructor

Reimplemented in [InOrder](#), [Parallel](#), [Branch](#), [DriveForwardCommand](#), [TurnDegreesCommand](#), [TurnToHeadingCommand](#), [PurePursuitCommand](#), and [DriveStopCommand](#).

5.3.2.2 run()

```
virtual bool AutoCommand::run ( ) [inline], [virtual]
```

Executes the command Overridden by child classes

Returns

true when the command is finished, false otherwise

Reimplemented in [FunctionCommand](#), [WaitUntilCondition](#), [InOrder](#), [Parallel](#), [Branch](#), [Async](#), [DelayCommand](#), [DriveForwardCommand](#), [TurnDegreesCommand](#), [DriveToPointCommand](#), [TurnToHeadingCommand](#), [PurePursuitCommand](#), [DriveStopCommand](#), [OdomSetPosition](#), [SpinRPMCommand](#), [WaitUntilUpToSpeedCommand](#), [FlywheelStopCommand](#), and [FlywheelStopMotorsCommand](#).

5.3.3 Member Data Documentation

5.3.3.1 timeout_seconds

```
double AutoCommand::timeout_seconds = default_timeout
```

How long to run until we cancel this command. If the command is cancelled, [on_timeout\(\)](#) is called to allow any cleanup from the function. If the timeout_seconds ≤ 0 , no timeout will be applied and this command will run forever. A timeout can come in handy for some commands that can not reach the end due to some physical limitation such as

- a drive command hitting a wall and not being able to reach its target
- a command that waits until something is up to speed that never gets up to speed because of battery voltage
- something else...

The documentation for this class was generated from the following file:

- include/utils/command_structure/auto_command.h

5.4 Branch Class Reference

[Branch](#) chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO_CHOICE; any choice that is out of bounds set to NO_CHOICE.

```
#include <auto_command.h>
```

Inheritance diagram for Branch:

Public Member Functions

- **Branch** ([Condition](#) *cond, [AutoCommand](#) *false_choice, [AutoCommand](#) *true_choice)
- bool [run](#) () override
- void [on_timeout](#) () override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.4.1 Detailed Description

[Branch](#) chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO_CHOICE; any choice that is out of bounds set to NO_CHOICE.

5.4.2 Member Function Documentation

5.4.2.1 [on_timeout\(\)](#)

```
void Branch::on_timeout ( ) [override], [virtual]
```

What to do if we timeout instead of finishing. timeout is specified by the timeout seconds in the constructor

Reimplemented from [AutoCommand](#).

5.4.2.2 run()

```
bool Branch::run ( ) [override], [virtual]
```

Executes the command Overridden by child classes

Returns

true when the command is finished, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utls/command_structure/auto_command.h
- src/utls/command_structure/auto_command.cpp

5.5 CommandController Class Reference

```
#include <command_controller.h>
```

Public Member Functions

- **CommandController ()**
Create an empty [CommandController](#). Add Command with [CommandController::add\(\)](#)
- **CommandController (std::initializer_list< [AutoCommand](#) * > cmds)**
Create a [CommandController](#) with commands pre added. More can be added with [CommandController::add\(\)](#)
- void **add** (std::vector< [AutoCommand](#) * > cmds)
- void **add** ([AutoCommand](#) *cmd, double timeout_seconds=10.0)
- void **add** (std::vector< [AutoCommand](#) * > cmds, double timeout_sec)
- void **add_delay** (int ms)
- void **add_cancel_func** (std::function< bool(void)> true_if_cancel)
add_cancel_func specifies that when this func evaluates to true, to cancel the command controller
- void **run** ()
- bool **last_command_timed_out** ()

5.5.1 Detailed Description

File: [command_controller.h](#) Desc: A [CommandController](#) manages the AutoCommands that make up an autonomous route. The AutoCommands are kept in a queue and get executed and removed from the queue in FIFO order.

5.5.2 Constructor & Destructor Documentation

5.5.2.1 CommandController()

```
CommandController::CommandController (
    std::initializer_list< AutoCommand * > cmds ) [inline]
```

Create a [CommandController](#) with commands pre added. More can be added with [CommandController::add\(\)](#)

Parameters

<i>cmds</i>	
-------------	--

5.5.3 Member Function Documentation

5.5.3.1 add() [1/3]

```
void CommandController::add (
    AutoCommand * cmd,
    double timeout_seconds = 10.0 )
```

File: command_controller.cpp Desc: A [CommandController](#) manages the AutoCommands that make up an autonomous route. The AutoCommands are kept in a queue and get executed and removed from the queue in FIFO order. Adds a command to the queue

Parameters

<i>cmd</i>	the AutoCommand we want to add to our list
<i>timeout_seconds</i>	the number of seconds we will let the command run for. If it exceeds this, we cancel it and run on_timeout

5.5.3.2 add() [2/3]

```
void CommandController::add (
    std::vector< AutoCommand * > cmds )
```

Adds a command to the queue

Parameters

<i>cmd</i>	the AutoCommand we want to add to our list
<i>timeout_seconds</i>	the number of seconds we will let the command run for. If it exceeds this, we cancel it and run on_timeout. if it is <= 0 no time out will be applied

Add multiple commands to the queue. No timeout here.

Parameters

<i>cmds</i>	the AutoCommands we want to add to our list
-------------	---

5.5.3.3 add() [3/3]

```
void CommandController::add (
    std::vector< AutoCommand * > cmds,
    double timeout_sec )
```

Add multiple commands to the queue. No timeout here.

Parameters

<i>cmds</i>	the AutoCommands we want to add to our list Add multiple commands to the queue. No timeout here.
<i>cmds</i>	the AutoCommands we want to add to our list
<i>timeout_sec</i>	timeout in seconds to apply to all commands if they are still the default

Add multiple commands to the queue. No timeout here.

Parameters

<i>cmds</i>	the AutoCommands we want to add to our list
<i>timeout</i>	timeout in seconds to apply to all commands if they are still the default

5.5.3.4 add_cancel_func()

```
void CommandController::add_cancel_func (
    std::function< bool(void)> true_if_cancel )
```

add_cancel_func specifies that when this func evaluates to true, to cancel the command controller

Parameters

<i>true_if_cancel</i>	a function that returns true when we want to cancel the command controller
-----------------------	--

5.5.3.5 add_delay()

```
void CommandController::add_delay (
    int ms )
```

Adds a command that will delay progression of the queue

Parameters

<i>ms</i>	- number of milliseconds to wait before continuing execution of autonomous
-----------	--

5.5.3.6 last_command_timed_out()

```
bool CommandController::last_command_timed_out ( )
```

last_command_timed_out tells how the last command ended Use this if you want to make decisions based on the end of the last command

Returns

true if the last command timed out. false if it finished regularly

5.5.3.7 run()

```
void CommandController::run ( )
```

Begin execution of the queue Execute and remove commands in FIFO order

The documentation for this class was generated from the following files:

- include/utls/command_structure/command_controller.h
- src/utls/command_structure/command_controller.cpp

5.6 Condition Class Reference

```
#include <auto_command.h>
```

Inheritance diagram for Condition:

Public Member Functions

- virtual bool **test** ()=0

5.6.1 Detailed Description

A [Condition](#) is a function that returns true or false `is_even` is a predicate that would return true if a number is even For our purposes, a [Condition](#) is a choice to be made at runtime `drive_sys.reached_point(10, 30)` is a predicate `time.has_elapsed(10, vex::seconds)` is a predicate extend this class for different choices you wish to make

The documentation for this class was generated from the following file:

- include/utls/command_structure/auto_command.h

5.7 CustomEncoder Class Reference

```
#include <custom_encoder.h>
```

Inheritance diagram for CustomEncoder:

Public Member Functions

- [CustomEncoder](#) (vex::triport::port &port, double ticks_per_rev)
- void [setRotation](#) (double val, vex::rotationUnits units)
- void [setPosition](#) (double val, vex::rotationUnits units)
- double [rotation](#) (vex::rotationUnits units)
- double [position](#) (vex::rotationUnits units)
- double [velocity](#) (vex::velocityUnits units)

5.7.1 Detailed Description

A wrapper class for the vex encoder that allows the use of 3rd party encoders with different tick-per-revolution values.

5.7.2 Constructor & Destructor Documentation

5.7.2.1 CustomEncoder()

```
CustomEncoder::CustomEncoder (
    vex::triport::port & port,
    double ticks_per_rev )
```

Construct an encoder with a custom number of ticks

Parameters

<i>port</i>	the triport port on the brain the encoder is plugged into
<i>ticks_per_rev</i>	the number of ticks the encoder will report for one revolution

5.7.3 Member Function Documentation

5.7.3.1 position()

```
double CustomEncoder::position (
    vex::rotationUnits units )
```

get the position that the encoder is at

Parameters

<i>units</i>	the unit we want the return value to be in
--------------	--

Returns

the position of the encoder in the units specified

5.7.3.2 rotation()

```
double CustomEncoder::rotation (
    vex::rotationUnits units )
```

get the rotation that the encoder is at

Parameters

<i>units</i>	the unit we want the return value to be in
--------------	--

Returns

the rotation of the encoder in the units specified

5.7.3.3 setPosition()

```
void CustomEncoder::setPosition (
    double val,
    vex::rotationUnits units )
```

sets the stored position of the encoder. Any further movements will be from this value

Parameters

<i>val</i>	the numerical value of the position we are setting to
<i>units</i>	the unit of val

5.7.3.4 setRotation()

```
void CustomEncoder::setRotation (
    double val,
    vex::rotationUnits units )
```

sets the stored rotation of the encoder. Any further movements will be from this value

Parameters

<i>val</i>	the numerical value of the angle we are setting to
<i>units</i>	the unit of val

5.7.3.5 velocity()

```
double CustomEncoder::velocity (
    vex::velocityUnits units )
```

get the velocity that the encoder is moving at

Parameters

<i>units</i>	the unit we want the return value to be in
--------------	--

Returns

the velocity of the encoder in the units specified

The documentation for this class was generated from the following files:

- include/subsystems/custom_encoder.h
- src/subsystems/custom_encoder.cpp

5.8 DelayCommand Class Reference

```
#include <delay_command.h>
```

Inheritance diagram for DelayCommand:

**Public Member Functions**

- [DelayCommand](#) (int ms)
- bool [run](#) () override

Public Member Functions inherited from [AutoCommand](#)

- virtual void [on_timeout](#) ()
- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.8.1 Detailed Description

File: [delay_command.h](#) Desc: A [DelayCommand](#) will make the robot wait the set amount of milliseconds before continuing execution of the autonomous route

5.8.2 Constructor & Destructor Documentation

5.8.2.1 DelayCommand()

```
DelayCommand::DelayCommand (
    int ms ) [inline]
```

Construct a delay command

Parameters

<i>ms</i>	the number of milliseconds to delay for
-----------	---

5.8.3 Member Function Documentation

5.8.3.1 run()

```
bool DelayCommand::run ( ) [inline], [override], [virtual]
```

Delays for the amount of milliseconds stored in the command Overrides run from [AutoCommand](#)

Returns

true when complete

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following file:

- include/utls/command_structure/delay_command.h

5.9 DriveForwardCommand Class Reference

```
#include <drive_commands.h>
```

Inheritance diagram for DriveForwardCommand:

Public Member Functions

- [DriveForwardCommand](#) ([TankDrive](#) &drive_sys, [Feedback](#) &feedback, double inches, directionType dir, double max_speed=1)
- bool [run](#) () override
- void [on_timeout](#) () override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.9.1 Detailed Description

[AutoCommand](#) wrapper class for the `drive_forward` function in the [TankDrive](#) class

5.9.2 Constructor & Destructor Documentation

5.9.2.1 DriveForwardCommand()

```
DriveForwardCommand::DriveForwardCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double inches,
    directionType dir,
    double max_speed = 1 )
```

File: [drive_commands.h](#) Desc: Holds all the [AutoCommand](#) subclasses that wrap (currently) [TankDrive](#) functions

Currently includes:

- `drive_forward`
- `turn_degrees`
- `drive_to_point`
- `turn_to_heading`
- `stop`

Also holds [AutoCommand](#) subclasses that wrap [OdometryBase](#) functions

Currently includes:

- `set_position` Construct a DriveForward Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>inches</i>	how far forward to drive
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

5.9.3 Member Function Documentation**5.9.3.1 on_timeout()**

```
void DriveForwardCommand::on_timeout ( ) [override], [virtual]
```

Cleans up drive system if we time out before finishing

reset the drive system if we timeout

Reimplemented from [AutoCommand](#).

5.9.3.2 run()

```
bool DriveForwardCommand::run ( ) [override], [virtual]
```

Run drive_forward Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utlis/command_structure/drive_commands.h
- src/utlis/command_structure/drive_commands.cpp

5.10 DriveStopCommand Class Reference

```
#include <drive_commands.h>
```

Inheritance diagram for DriveStopCommand:

Public Member Functions

- [DriveStopCommand](#) ([TankDrive](#) &drive_sys)
- bool [run](#) () override
- void [on_timeout](#) () override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.10.1 Detailed Description

[AutoCommand](#) wrapper class for the stop() function in the [TankDrive](#) class

5.10.2 Constructor & Destructor Documentation

5.10.2.1 DriveStopCommand()

```
DriveStopCommand::DriveStopCommand (
    TankDrive & drive_sys )
```

Construct a DriveStop Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
------------------	------------------------------------

5.10.3 Member Function Documentation

5.10.3.1 on_timeout()

```
void DriveStopCommand::on_timeout ( ) [override], [virtual]
```

What to do if we timeout instead of finishing. timeout is specified by the timeout seconds in the constructor

Reimplemented from [AutoCommand](#).

5.10.3.2 run()

```
bool DriveStopCommand::run ( ) [override], [virtual]
```

Stop the drive system Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Stop the drive train Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/drive_commands.h
- src/utils/command_structure/drive_commands.cpp

5.11 DriveToPointCommand Class Reference

```
#include <drive_commands.h>
```

Inheritance diagram for DriveToPointCommand:

Public Member Functions

- [DriveToPointCommand](#) ([TankDrive](#) &drive_sys, [Feedback](#) &feedback, double x, double y, directionType dir, double max_speed=1)
- [DriveToPointCommand](#) ([TankDrive](#) &drive_sys, [Feedback](#) &feedback, [point_t](#) point, directionType dir, double max_speed=1)
- bool [run](#) () override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.11.1 Detailed Description

[AutoCommand](#) wrapper class for the `drive_to_point` function in the [TankDrive](#) class

5.11.2 Constructor & Destructor Documentation

5.11.2.1 DriveToPointCommand() [1/2]

```
DriveToPointCommand::DriveToPointCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double x,
    double y,
    directionType dir,
    double max_speed = 1 )
```

Construct a DriveForward Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>x</i>	where to drive in the x dimension
<i>y</i>	where to drive in the y dimension
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

5.11.2.2 DriveToPointCommand() [2/2]

```
DriveToPointCommand::DriveToPointCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    point\_t point,
    directionType dir,
    double max_speed = 1 )
```

Construct a DriveForward Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>point</i>	the point to drive to
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

5.11.3 Member Function Documentation**5.11.3.1 run()**

```
bool DriveToPointCommand::run ( ) [override], [virtual]
```

Run drive_to_point Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/drive_commands.h
- src/utils/command_structure/drive_commands.cpp

5.12 AutoChooser::entry_t Struct Reference

```
#include <auto_chooser.h>
```

Public Attributes

- int [x](#)
- int [y](#)
- int [width](#)
- int [height](#)
- std::string [name](#)

5.12.1 Detailed Description

[entry_t](#) is a datatype used to store information that the chooser knows about an auto selection button

5.12.2 Member Data Documentation

5.12.2.1 height

```
int AutoChooser::entry_t::height
```

height of the block

5.12.2.2 name

```
std::string AutoChooser::entry_t::name
```

name of the auto represented by the block

5.12.2.3 width

```
int AutoChooser::entry_t::width
```

width of the block

5.12.2.4 x

```
int AutoChooser::entry_t::x
```

screen x position of the block

5.12.2.5 y

```
int AutoChooser::entry_t::y
```

screen y position of the block

The documentation for this struct was generated from the following file:

- include/utils/auto_chooser.h

5.13 Feedback Class Reference

```
#include <feedback_base.h>
```

Inheritance diagram for Feedback:

Public Types

- enum **FeedbackType** { **PIDType** , **FeedforwardType** , **OtherType** }

Public Member Functions

- virtual void **init** (double start_pt, double set_pt)=0
- virtual double **update** (double val)=0
- virtual double **get** ()=0
- virtual void **set_limits** (double lower, double upper)=0
- virtual bool **is_on_target** ()=0
- virtual Feedback::FeedbackType **get_type** ()

5.13.1 Detailed Description

Interface so that subsystems can easily switch between feedback loops

Author

Ryan McGee

Date

9/25/2022

5.13.2 Member Function Documentation

5.13.2.1 **get()**

```
virtual double Feedback::get ( ) [pure virtual]
```

Returns

the last saved result from the feedback controller

Implemented in [MotionController](#), [PID](#), and [PIDFF](#).

5.13.2.2 **init()**

```
virtual void Feedback::init (
    double start_pt,
    double set_pt ) [pure virtual]
```

Initialize the feedback controller for a movement

Parameters

<i>start_pt</i>	the current sensor value
<i>set_pt</i>	where the sensor value should be

Implemented in [MotionController](#), [PID](#), and [PIDFF](#).

5.13.2.3 is_on_target()

```
virtual bool Feedback::is_on_target ( ) [pure virtual]
```

Returns

true if the feedback controller has reached it's setpoint

Implemented in [MotionController](#), [PID](#), and [PIDFF](#).

5.13.2.4 set_limits()

```
virtual void Feedback::set_limits (
    double lower,
    double upper ) [pure virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

Parameters

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implemented in [MotionController](#), [PID](#), and [PIDFF](#).

5.13.2.5 update()

```
virtual double Feedback::update (
    double val ) [pure virtual]
```

Iterate the feedback loop once with an updated sensor value

Parameters

<i>val</i>	value from the sensor
------------	-----------------------

Returns

feedback loop result

Implemented in [MotionController](#), [PID](#), and [PIDFF](#).

The documentation for this class was generated from the following file:

- `include/utls/feedback_base.h`

5.14 FeedForward Class Reference

```
#include <feedforward.h>
```

Classes

- struct [ff_config_t](#)

Public Member Functions

- [FeedForward](#) ([ff_config_t](#) &cfg)
- double [calculate](#) (double v, double a, double pid_ref=0.0)
Perform the feedforward calculation.

5.14.1 Detailed Description

[FeedForward](#)

Stores the feedforward constants, and allows for quick computation. Feedforward should be used in systems that require smooth precise movements and have high inertia, such as drivetrains and lifts.

This is best used alongside a [PID](#) loop, with the form: `output = pid.get() + feedforward.calculate(v, a);`

In this case, the feedforward does the majority of the heavy lifting, and the pid loop only corrects for inconsistencies

For information about tuning feedforward, I recommend looking at this post: <https://www.chiefdelphi.com/t/paper-frc-drivetrain-characterization/160915> (yes I know it's for FRC but trust me, it's useful)

Author

Ryan McGee

Date

6/13/2022

5.14.2 Constructor & Destructor Documentation

5.14.2.1 [FeedForward](#)()

```
FeedForward::FeedForward (
    ff\_config\_t & cfg ) [inline]
```

Creates a [FeedForward](#) object.

Parameters

<i>cfg</i>	Configuration Struct for tuning
------------	---------------------------------

5.14.3 Member Function Documentation

5.14.3.1 calculate()

```
double FeedForward::calculate (
    double v,
    double a,
    double pid_ref = 0.0 ) [inline]
```

Perform the feedforward calculation.

This calculation is the equation: $F = kG + kS \cdot \text{sgn}(v) + kV \cdot v + kA \cdot a$

Parameters

<i>v</i>	Requested velocity of system
<i>a</i>	Requested acceleration of system

Returns

A feedforward that should closely represent the system if tuned correctly

The documentation for this class was generated from the following file:

- include/utlis/feedforward.h

5.15 FeedForward::ff_config_t Struct Reference

```
#include <feedforward.h>
```

Public Attributes

- double *kS*
- double *kV*
- double *kA*
- double *kG*

5.15.1 Detailed Description

ff_config_t holds the parameters to make the theoretical model of a real world system equation is of the form kS if the system is not stopped, 0 otherwise

- $kV \cdot \text{desired velocity}$
- $kA \cdot \text{desired acceleration}$
- kG

5.15.2 Member Data Documentation

5.15.2.1 kA

```
double FeedForward::ff_config_t::kA
```

kA - Acceleration coefficient: the power required to change the mechanism's speed. Multiplied by the requested acceleration.

5.15.2.2 kG

```
double FeedForward::ff_config_t::kG
```

kG - Gravity coefficient: only needed for lifts. The power required to overcome gravity and stay at steady state.

5.15.2.3 kS

```
double FeedForward::ff_config_t::kS
```

Coefficient to overcome static friction: the point at which the motor *starts* to move.

5.15.2.4 kV

```
double FeedForward::ff_config_t::kV
```

Veclocity coefficient: the power required to keep the mechanism in motion. Multiplied by the requested velocity.

The documentation for this struct was generated from the following file:

- include/utlis/feedforward.h

5.16 Flywheel Class Reference

```
#include <flywheel.h>
```

Public Member Functions

- [Flywheel](#) (motor_group &motors, [PID::pid_config_t](#) &pid_config, [FeedForward::ff_config_t](#) &ff_config, const double ratio)

5.16.1 Detailed Description

a [Flywheel](#) class that handles all control of a high inertia spinning disk. It gives multiple options for what control system to use in order to control wheel velocity and functions alerting the user when the flywheel is up to speed. [Flywheel](#) is a set and forget class. Once you create it you can call [spinRPM](#) or [stop](#) on it at any time and it will take all necessary steps to accomplish this.

5.16.2 Constructor & Destructor Documentation

5.16.2.1 [Flywheel\(\)](#) [1/4]

```
Flywheel::Flywheel (
    motor_group & motors,
    PID::pid_config_t & pid_config,
    FeedForward::ff_config_t & ff_config,
    const double ratio )
```

Create the [Flywheel](#) object using [PID](#) + feedforward for control.

Parameters

<i>motors</i>	pointer to the motors on the fly wheel
<i>pid_config</i>	pointer the pid config to use
<i>ff_config</i>	the feedforward config to use
<i>ratio</i>	ratio of the whatever just multiplies the velocity

Create the [Flywheel](#) object using [PID](#) + feedforward for control.

5.16.2.2 Flywheel() [2/4]

```
Flywheel::Flywheel (
    motor_group & motors,
    FeedForward::ff_config_t & ff_config,
    const double ratio )
```

Create the [Flywheel](#) object using only feedforward for control

Parameters

<i>motors</i>	the motors on the fly wheel
<i>ff_config</i>	the feedforward config to use
<i>ratio</i>	ratio of the whatever just multiplies the velocity

Create the [Flywheel](#) object using only feedforward for control

5.16.2.3 Flywheel() [3/4]

```
Flywheel::Flywheel (
    motor_group & motors,
    double tbh_gain,
    const double ratio )
```

Create the [Flywheel](#) object using Take Back Half for control

Parameters

<i>motors</i>	the motors on the fly wheel
<i>tbh_gain</i>	the TBH control paramater
<i>ratio</i>	ratio of the whatever just multiplies the velocity

Create the [Flywheel](#) object using Take Back Half for control

5.16.2.4 Flywheel() [4/4]

```
Flywheel::Flywheel (
    motor_group & motors,
    const double ratio )
```

Create the [Flywheel](#) object using Bang Bang for control

Parameters

<i>motors</i>	the motors on the fly wheel
<i>ratio</i>	ratio of the whatever just multiplies the velocity

Create the [Flywheel](#) object using Bang Bang for control

5.16.3 Member Function Documentation

5.16.3.1 `getDesiredRPM()`

```
double Flywheel::getDesiredRPM ( )
```

Return the RPM that the flywheel is currently trying to achieve

Returns

RPM the target rpm

Return the current value that the RPM should be set to

5.16.3.2 `getFeedforwardValue()`

```
double Flywheel::getFeedforwardValue ( )
```

returns the current OUT value of the [PID](#) - the value that the [PID](#) would set the motors to

returns the current OUT value of the Feedforward - the value that the Feedforward would set the motors to

Returns

the voltage that feedforward wants the motors at to achieve the target RPM

5.16.3.3 `getMotors()`

```
motor_group * Flywheel::getMotors ( )
```

Returns a POINTER to the motors

Returns a POINTER TO the motors; not currently used.

Returns

motorPointer -pointer to the motors

5.16.3.4 `getPID()`

```
PID * Flywheel::getPID ( )
```

Returns a POINTER to the [PID](#).

Returns a POINTER TO the [PID](#); not currently used.

Returns

pidPointer -pointer to the [PID](#)

5.16.3.5 getPIDValue()

```
double Flywheel::getPIDValue ( )
```

returns the current OUT value of the PID - the value that the PID would set the motors to

returns the current OUT value of the PID - the value that the PID would set the motors to

Returns

the voltage that PID wants the motors at to achieve the target RPM

5.16.3.6 getRPM()

```
double Flywheel::getRPM ( )
```

return the current smoothed velocity of the flywheel motors, in RPM

5.16.3.7 getTBHGain()

```
double Flywheel::getTBHGain ( )
```

get the gain used for TBH control

get the gain used for TBH control

Returns

the gain used in TBH control

5.16.3.8 isTaskRunning()

```
bool Flywheel::isTaskRunning ( )
```

Checks if the background RPM controlling task is running

Returns

true if the task is running

Checks if the background RPM controlling task is running

Returns

taskRunning - If the task is running

5.16.3.9 measureRPM()

```
double Flywheel::measureRPM ( )
```

make a measurement of the current RPM of the flywheel motor and return a smoothed version

return the current velocity of the flywheel motors, in RPM

Returns

the measured velocity of the flywheel

5.16.3.10 setPIDTarget()

```
void Flywheel::setPIDTarget (
    double value )
```

Sets the value of the PID target

Parameters

<i>value</i>	- desired value of the PID
--------------	--

5.16.3.11 spin_manual()

```
void Flywheel::spin_manual (
    double speed,
    directionType dir = fwd )
```

Spin motors using voltage; defaults forward at 12 volts FOR USE BY OPCONTROL AND AUTONOMOUS - this only applies if the RPM thread is not running

Parameters

<i>speed</i>	- speed (between -1 and 1) to set the motor
<i>dir</i>	- direction that the motor moves in; defaults to forward

5.16.3.12 spin_raw()

```
void Flywheel::spin_raw (
    double speed,
    directionType dir = fwd )
```

Spin motors using voltage; defaults forward at 12 volts FOR USE BY TASKS ONLY

Parameters

<i>speed</i>	- speed (between -1 and 1) to set the motor
<i>dir</i>	- direction that the motor moves in; defaults to forward

5.16.3.13 spinRPM()

```
void Flywheel::spinRPM (
    int inputRPM )
```

starts or sets the RPM thread at new value what control scheme is dependent on control_style

Parameters

<i>rpm</i>	- the RPM we want to spin at
------------	------------------------------

starts or sets the RPM thread at new value what control scheme is dependent on control_style

Parameters

<i>inputRPM</i>	- set the current RPM
-----------------	-----------------------

5.16.3.14 stop()

```
void Flywheel::stop ( )
```

stop the RPM thread and the wheel

5.16.3.15 stopMotors()

```
void Flywheel::stopMotors ( )
```

stop only the motors; exclusively for BANG BANG use

5.16.3.16 stopNonTasks()

```
void Flywheel::stopNonTasks ( )
```

Stop the motors if the task isn't running - stop manual control

5.16.3.17 updatePID()

```
void Flywheel::updatePID (
    double value )
```

updates the value of the [PID](#)

Parameters

<i>value</i>	- value to update the PID with
--------------	--

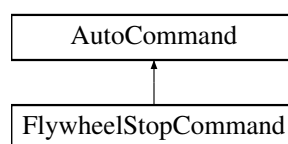

The documentation for this class was generated from the following files:

- include/subsystems/flywheel.h
- src/subsystems/flywheel.cpp

5.17 FlywheelStopCommand Class Reference

```
#include <flywheel_commands.h>
```

Inheritance diagram for FlywheelStopCommand:

Public Member Functions

- [FlywheelStopCommand](#) ([Flywheel](#) &flywheel)
- bool [run](#) () override

Public Member Functions inherited from [AutoCommand](#)

- virtual void [on_timeout](#) ()
- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.17.1 Detailed Description

[AutoCommand](#) wrapper class for the stop function in the [Flywheel](#) class

5.17.2 Constructor & Destructor Documentation

5.17.2.1 FlywheelStopCommand()

```
FlywheelStopCommand::FlywheelStopCommand (
    Flywheel & flywheel )
```

Construct a [FlywheelStopCommand](#)

Parameters

<i>flywheel</i>	the flywheel system we are commanding
-----------------	---------------------------------------

5.17.3 Member Function Documentation

5.17.3.1 run()

```
bool FlywheelStopCommand::run ( ) [override], [virtual]
```

Run stop Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/flywheel_commands.h
- src/utils/command_structure/flywheel_commands.cpp

5.18 FlywheelStopMotorsCommand Class Reference

```
#include <flywheel_commands.h>
```

Inheritance diagram for FlywheelStopMotorsCommand:

**Public Member Functions**

- [FlywheelStopMotorsCommand](#) ([Flywheel](#) &flywheel)
- bool [run](#) () override

Public Member Functions inherited from [AutoCommand](#)

Additional Inherited Members**Public Attributes inherited from [AutoCommand](#)**

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.18.1 Detailed Description

[AutoCommand](#) wrapper class for the stopMotors function in the [Flywheel](#) class

5.18.2 Constructor & Destructor Documentation

5.18.2.1 FlywheelStopMotorsCommand()

```
FlywheelStopMotorsCommand::FlywheelStopMotorsCommand (
    Flywheel & flywheel )
```

Construct a FlywheelStopMotors Command

Parameters

<i>flywheel</i>	the flywheel system we are commanding
-----------------	---------------------------------------

5.18.3 Member Function Documentation

5.18.3.1 run()

```
bool FlywheelStopMotorsCommand::run ( ) [override], [virtual]
```

Run stop Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/flywheel_commands.h
- src/utils/command_structure/flywheel_commands.cpp

5.19 FlywheelStopNonTasksCommand Class Reference

```
#include <flywheel_commands.h>
```

Inheritance diagram for FlywheelStopNonTasksCommand:

Additional Inherited Members

Public Member Functions inherited from [AutoCommand](#)

- virtual void [on_timeout](#) ()
- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.19.1 Detailed Description

[AutoCommand](#) wrapper class for the stopNonTasks function in the [Flywheel](#) class

The documentation for this class was generated from the following files:

- include/utls/command_structure/flywheel_commands.h
- src/utls/command_structure/flywheel_commands.cpp

5.20 FunctionCommand Class Reference

```
#include <auto_command.h>
```

Inheritance diagram for FunctionCommand:

Public Member Functions

- **FunctionCommand** (std::function< bool(void)> f)
- bool [run](#) ()

Public Member Functions inherited from [AutoCommand](#)

- virtual void [on_timeout](#) ()
- [AutoCommand](#) * **withTimeout** (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.20.1 Detailed Description

[FunctionCommand](#) is fun and good way to do simple things Printing, launching nukes, and other quick and dirty one time things

5.20.2 Member Function Documentation

5.20.2.1 run()

```
bool FunctionCommand::run ( ) [inline], [virtual]
```

Executes the command Overridden by child classes

Returns

true when the command is finished, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following file:

- include/utils/command_structure/auto_command.h

5.21 FunctionCondition Class Reference

[FunctionCondition](#) is a quick and dirty [Condition](#) to wrap some expression that should be evaluated at runtime.

```
#include <auto_command.h>
```

Inheritance diagram for FunctionCondition:

Public Member Functions

- **FunctionCondition** (std::function< bool()> cond, std::function< void(void)> timeout=[]() {})
- bool [test](#) () override

5.21.1 Detailed Description

[FunctionCondition](#) is a quick and dirty [Condition](#) to wrap some expression that should be evaluated at runtime.

5.21.2 Member Function Documentation

5.21.2.1 test()

```
bool FunctionCondition::test ( ) [override], [virtual]
```

Implements [Condition](#).

The documentation for this class was generated from the following files:

- include/utls/command_structure/auto_command.h
- src/utls/command_structure/auto_command.cpp

5.22 GenericAuto Class Reference

```
#include <generic_auto.h>
```

Public Member Functions

- bool [run](#) (bool blocking)
- void [add](#) (state_ptr new_state)
- void [add_async](#) (state_ptr async_state)
- void [add_delay](#) (int ms)

5.22.1 Detailed Description

[GenericAuto](#) provides a pleasant interface for organizing an auto path steps of the path can be added with [add\(\)](#) and when ready, calling [run\(\)](#) will begin executing the path

5.22.2 Member Function Documentation

5.22.2.1 add()

```
void GenericAuto::add (
    state_ptr new_state )
```

Add a new state to the autonomous via function point of type "bool (ptr*)()"

Parameters

<i>new_state</i>	the function to run
------------------	---------------------

5.22.2.2 add_async()

```
void GenericAuto::add_async (
```

```
state_ptr async_state )
```

Add a new state to the autonomous via function point of type "bool (ptr*)()" that will run asynchronously

Parameters

<i>async_state</i>	the function to run
--------------------	---------------------

5.22.2.3 add_delay()

```
void GenericAuto::add_delay (
    int ms )
```

add_delay adds a period where the auto system will simply wait for the specified time

Parameters

<i>ms</i>	how long to wait in milliseconds
-----------	----------------------------------

5.22.2.4 run()

```
bool GenericAuto::run (
    bool blocking )
```

The method that runs the autonomous. If 'blocking' is true, then this method will run through every state until it finished.

If blocking is false, then assuming every state is also non-blocking, the method will run through the current state in the list and return immediately.

Parameters

<i>blocking</i>	Whether or not to block the thread until all states have run
-----------------	--

Returns

true after all states have finished.

The documentation for this class was generated from the following files:

- include/utls/generic_auto.h
- src/utls/generic_auto.cpp

5.23 GraphDrawer Class Reference

Public Member Functions

- [GraphDrawer](#) (vex::brain::lcd &screen, int num_samples, std::string x_label, std::string y_label, vex::color col, bool draw_border, double lower_bound, double upper_bound)

a helper class to graph values on the brain screen

- void [add_sample](#) ([point_t](#) sample)
- void [draw](#) (int x, int y, int width, int height)

5.23.1 Constructor & Destructor Documentation

5.23.1.1 GraphDrawer()

```
GraphDrawer::GraphDrawer (
    vex::brain::lcd & screen,
    int num_samples,
    std::string x_label,
    std::string y_label,
    vex::color col,
    bool draw_border,
    double lower_bound,
    double upper_bound )
```

a helper class to graph values on the brain screen

Construct a [GraphDrawer](#)

Parameters

<i>screen</i>	a reference to Brain.screen we can save for later
<i>num_samples</i>	the graph works on a fixed window and will plot the last <code>num_samples</code> before the history is forgotten. Larger values give more context but may slow down if you have many graphs or an exceptionally high
<i>x_label</i>	the name of the x axis (currently unused)
<i>y_label</i>	the name of the y axis (currently unused)
<i>draw_border</i>	whether to draw the border around the graph. can be turned off if there are multiple graphs in the same space ie. a graph of error and output
<i>lower_bound</i>	the bottom of the window to graph. if <code>lower_bound == upperbound</code> , the graph will scale to it's datapoints
<i>upper_bound</i>	the top of the window to graph. if <code>lower_bound == upperbound</code> , the graph will scale to it's datapoints

5.23.2 Member Function Documentation

5.23.2.1 add_sample()

```
void GraphDrawer::add_sample (
    point\_t sample )
```

`add_sample` adds a point to the graph, removing one from the back

Parameters

<i>sample</i>	an x, y coordinate of the next point to graph
---------------	---

5.23.2.2 draw()

```
void GraphDrawer::draw (
    int x,
    int y,
    int width,
    int height )
```

draws the graph to the screen in the constructor

Parameters

<i>x</i>	x position of the top left of the graphed region
<i>y</i>	y position of the top left of the graphed region
<i>width</i>	the width of the graphed region
<i>height</i>	the height of the graphed region

The documentation for this class was generated from the following files:

- include/utils/graph_drawer.h
- src/utils/graph_drawer.cpp

5.24 PurePursuit::hermite_point Struct Reference

```
#include <pure_pursuit.h>
```

Public Member Functions

- [point_t](#) **getPoint** () const
- [Vector2D](#) **getTangent** () const

Public Attributes

- double **x**
- double **y**
- double **dir**
- double **mag**

5.24.1 Detailed Description

a position along the hermite path contains a position and orientation information that the robot would be at at this point

The documentation for this struct was generated from the following file:

- include/utils/pure_pursuit.h

5.25 IfTimePassed Class Reference

[IfTimePassed](#) tests based on time since the command controller was constructed. Returns true if elapsed time > time_s.

```
#include <auto_command.h>
```

Inheritance diagram for IfTimePassed:

Public Member Functions

- **IfTimePassed** (double time_s)
- bool [test](#) () override

5.25.1 Detailed Description

[IfTimePassed](#) tests based on time since the command controller was constructed. Returns true if elapsed time > time_s.

5.25.2 Member Function Documentation

5.25.2.1 test()

```
bool IfTimePassed::test ( ) [override], [virtual]
```

Implements [Condition](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/auto_command.h
- src/utils/command_structure/auto_command.cpp

5.26 InOrder Class Reference

[InOrder](#) runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?

```
#include <auto_command.h>
```

Inheritance diagram for InOrder:

Public Member Functions

- **InOrder** (std::queue< [AutoCommand](#) * > cmds)
- **InOrder** (std::initializer_list< [AutoCommand](#) * > cmds)
- bool [run](#) () override
- void [on_timeout](#) () override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * **withTimeout** (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double **default_timeout** = 10.0

5.26.1 Detailed Description

[InOrder](#) runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?

5.26.2 Member Function Documentation

5.26.2.1 [on_timeout\(\)](#)

```
void InOrder::on_timeout ( ) [override], [virtual]
```

What to do if we timeout instead of finishing. timeout is specified by the timeout seconds in the constructor

Reimplemented from [AutoCommand](#).

5.26.2.2 [run\(\)](#)

```
bool InOrder::run ( ) [override], [virtual]
```

Executes the command Overridden by child classes

Returns

true when the command is finished, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/auto_command.h
- src/utils/command_structure/auto_command.cpp

5.27 Lift< T > Class Template Reference

```
#include <lift.h>
```

Classes

- struct [lift_cfg_t](#)

Public Member Functions

- [Lift](#) (motor_group &lift_motors, [lift_cfg_t](#) &lift_cfg, map< T, double > &setpoint_map, limit *homing_switch=NULL)
- void [control_continuous](#) (bool up_ctrl, bool down_ctrl)
- void [control_manual](#) (bool up_btn, bool down_btn, int volt_up, int volt_down)
- void [control_setpoints](#) (bool up_step, bool down_step, vector< T > pos_list)
- bool [set_position](#) (T pos)
- bool [set_setpoint](#) (double val)
- double [get_setpoint](#) ()
- void [hold](#) ()
- void [home](#) ()
- bool [get_async](#) ()
- void [set_async](#) (bool val)
- void [set_sensor_function](#) (double(*fn_ptr)(void))
- void [set_sensor_reset](#) (void(*fn_ptr)(void))

5.27.1 Detailed Description

```
template<typename T>
```

```
class Lift< T >
```

LIFT A general class for lifts (e.g. 4bar, dr4bar, linear, etc) Uses a [PID](#) to hold the lift at a certain height under load, and to move the lift to different heights

Author

Ryan McGee

5.27.2 Constructor & Destructor Documentation

5.27.2.1 Lift()

```
template<typename T >
Lift< T >::Lift (
    motor_group & lift_motors,
    lift_cfg_t & lift_cfg,
    map< T, double > & setpoint_map,
    limit * homing_switch = NULL ) [inline]
```

Construct the [Lift](#) object and begin the background task that controls the lift.

Usage example: `/code{.cpp} enum Positions {UP, MID, DOWN}; map<Positions, double> setpt_map { {DOWN, 0.0}, {MID, 0.5}, {UP, 1.0} }; Lift<Positions> my_lift(motors, lift_cfg, setpt_map); /endcode`

Parameters

<i>lift_motors</i>	A set of motors, all set that positive rotation correlates with the lift going up
<i>lift_cfg</i>	Lift characterization information; PID tunings and movement speeds
<i>setpoint_map</i>	A map of enum type T, in which each enum entry corresponds to a different lift height

5.27.3 Member Function Documentation

5.27.3.1 control_continuous()

```
template<typename T >
void Lift< T >::control_continuous (
    bool up_ctrl,
    bool down_ctrl ) [inline]
```

Control the lift with an "up" button and a "down" button. Use [PID](#) to hold the lift when letting go.

Parameters

<i>up_ctrl</i>	Button controlling the "UP" motion
<i>down_ctrl</i>	Button controlling the "DOWN" motion

5.27.3.2 control_manual()

```
template<typename T >
void Lift< T >::control_manual (
    bool up_btn,
    bool down_btn,
    int volt_up,
    int volt_down ) [inline]
```

Control the lift with manual controls (no holding voltage)

Parameters

<i>up_btn</i>	Raise the lift when true
<i>down_btn</i>	Lower the lift when true
<i>volt_up</i>	Motor voltage when raising the lift
<i>volt_down</i>	Motor voltage when lowering the lift

5.27.3.3 control_setpoints()

```
template<typename T >
void Lift< T >::control_setpoints (
    bool up_step,
    bool down_step,
    vector< T > pos_list ) [inline]
```

Control the lift in "steps". When the "up" button is pressed, the lift will go to the next position as defined by `pos_list`. Order matters!

Parameters

<i>up_step</i>	A button that increments the position of the lift.
<i>down_step</i>	A button that decrements the position of the lift.
<i>pos_list</i>	A list of positions for the lift to go through. The higher the index, the higher the lift should be (generally).

5.27.3.4 `get_async()`

```
template<typename T >
bool Lift< T >::get_async ( ) [inline]
```

Returns

whether or not the background thread is running the lift

5.27.3.5 `get_setpoint()`

```
template<typename T >
double Lift< T >::get_setpoint ( ) [inline]
```

Returns

The current setpoint for the lift

5.27.3.6 `hold()`

```
template<typename T >
void Lift< T >::hold ( ) [inline]
```

Target the class's setpoint. Calculate the `PID` output and set the lift motors accordingly.

5.27.3.7 `home()`

```
template<typename T >
void Lift< T >::home ( ) [inline]
```

A blocking function that automatically homes the lift based on a sensor or hard stop, and sets the position to 0. A watchdog times out after 3 seconds, to avoid damage.

5.27.3.8 `set_async()`

```
template<typename T >
void Lift< T >::set_async (
    bool val ) [inline]
```

Enables or disables the background task. Note that running the control functions, or `set_position` functions will immediately re-enable the task for autonomous use.

Parameters

<i>val</i>	Whether or not the background thread should run the lift
------------	--

5.27.3.9 set_position()

```
template<typename T >
bool Lift< T >::set_position (
    T pos ) [inline]
```

Enable the background task, and send the lift to a position, specified by the setpoint map from the constructor.

Parameters

<i>pos</i>	A lift position enum type
------------	---------------------------

Returns

True if the pid has reached the setpoint

5.27.3.10 set_sensor_function()

```
template<typename T >
void Lift< T >::set_sensor_function (
    double(*) (void) fn_ptr ) [inline]
```

Creates a custom hook for any other type of sensor to be used on the lift. Example: `/code{.cpp} my_lift.set_sensor_function([](){return my_sensor.position();});/endcode`

Parameters

<i>fn_ptr</i>	Pointer to custom sensor function
---------------	-----------------------------------

5.27.3.11 set_sensor_reset()

```
template<typename T >
void Lift< T >::set_sensor_reset (
    void(*) (void) fn_ptr ) [inline]
```

Creates a custom hook to reset the sensor used in [set_sensor_function\(\)](#). Example: `/code{.cpp} my_lift.set_sensor_reset(my_sensor.resetPosition);/endcode`

5.27.3.12 set_setpoint()

```
template<typename T >
bool Lift< T >::set_setpoint (
    double val ) [inline]
```

Manually set a setpoint value for the lift [PID](#) to go to.

Parameters

<i>val</i>	Lift setpoint, in motor revolutions or sensor units defined by <code>get_sensor</code> . Cannot be outside the softstops.
------------	---

Returns

True if the pid has reached the setpoint

The documentation for this class was generated from the following file:

- `include/subsystems/lift.h`

5.28 `Lift< T >::lift_cfg_t` Struct Reference

```
#include <lift.h>
```

Public Attributes

- double `up_speed`
- double `down_speed`
- double `softstop_up`
- double `softstop_down`
- [PID::pid_config_t](#) `lift_pid_cfg`

5.28.1 Detailed Description

```
template<typename T>
struct Lift< T >::lift_cfg_t
```

[lift_cfg_t](#) holds the physical parameter specifications of a lify system. includes:

- maximum speeds for the system
- softstops to stop the lift from hitting the hard stops too hard

The documentation for this struct was generated from the following file:

- `include/subsystems/lift.h`

5.29 Logger Class Reference

Class to simplify writing to files.

```
#include <logger.h>
```

Public Member Functions

- [Logger](#) (const std::string &filename)
Create a logger that will save to a file.
- **Logger** (const [Logger](#) &l)=delete
copying not allowed
- **Logger & operator=** (const [Logger](#) &l)=delete
copying not allowed
- void [Log](#) (const std::string &s)
Write a string to the log.
- void [Log](#) (LogLevel level, const std::string &s)
Write a string to the log with a loglevel.
- void [Logln](#) (const std::string &s)
Write a string and newline to the log.
- void [Logln](#) (LogLevel level, const std::string &s)
Write a string and a newline to the log with a loglevel.
- void [Logf](#) (const char *fmt,...)
Write a formatted string to the log.
- void [Logf](#) (LogLevel level, const char *fmt,...)
Write a formatted string to the log with a loglevel.

Public Attributes

- const int **MAX_FORMAT_LEN** = 512
maximum size for a string to be before it's written

5.29.1 Detailed Description

Class to simplify writing to files.

5.29.2 Constructor & Destructor Documentation

5.29.2.1 Logger()

```
Logger::Logger (
    const std::string & filename ) [explicit]
```

Create a logger that will save to a file.

Parameters

<i>filename</i>	the file to save to
-----------------	---------------------

5.29.3 Member Function Documentation

5.29.3.1 Log() [1/2]

```
void Logger::Log (
    const std::string & s )
```

Write a string to the log.

Parameters

<i>s</i>	the string to write
----------	---------------------

5.29.3.2 Log() [2/2]

```
void Logger::Log (
    LogLevel level,
    const std::string & s )
```

Write a string to the log with a loglevel.

Parameters

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>s</i>	the string to write

5.29.3.3 Logf() [1/2]

```
void Logger::Logf (
    const char * fmt,
    ... )
```

Write a formatted string to the log.

Parameters

<i>fmt</i>	the format string (like printf)
<i>...</i>	the args

5.29.3.4 Logf() [2/2]

```
void Logger::Logf (
    LogLevel level,
    const char * fmt,
    ... )
```

Write a formatted string to the log with a loglevel.

Parameters

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>fmt</i>	the format string (like printf)
...	the args

5.29.3.5 Logln() [1/2]

```
void Logger::Logln (
    const std::string & s )
```

Write a string and newline to the log.

Parameters

<i>s</i>	the string to write
----------	---------------------

5.29.3.6 Logln() [2/2]

```
void Logger::Logln (
    LogLevel level,
    const std::string & s )
```

Write a string and a newline to the log with a loglevel.

Parameters

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>s</i>	the string to write

The documentation for this class was generated from the following files:

- include/utils/logger.h
- src/utils/logger.cpp

5.30 MotionController::m_profile_cfg_t Struct Reference

```
#include <motion_controller.h>
```

Public Attributes

- double **max_v**
the maximum velocity the robot can drive
- double **accel**
the most acceleration the robot can do
- [PID::pid_config_t](#) **pid_cfg**
configuration parameters for the internal [PID](#) controller
- [FeedForward::ff_config_t](#) **ff_cfg**
configuration parameters for the internal

5.30.1 Detailed Description

m_profile_config holds all data the motion controller uses to plan paths. When motion profile is given a target to drive to, max_v and accel are used to make the trapezoid profile instructing the controller how to drive. pid_cfg, ff_cfg are used to find the motor outputs necessary to execute this path.

The documentation for this struct was generated from the following file:

- include/Utils/motion_controller.h

5.31 MecanumDrive Class Reference

```
#include <mecanum_drive.h>
```

Classes

- struct [mecanumdrive_config_t](#)

Public Member Functions

- [MecanumDrive](#) (vex::motor &left_front, vex::motor &right_front, vex::motor &left_rear, vex::motor &right_rear, vex::rotation *lateral_wheel=NULL, vex::inertial *imu=NULL, [mecanumdrive_config_t](#) *config=NULL)
- void [drive_raw](#) (double direction_deg, double magnitude, double rotation)
- void [drive](#) (double left_y, double left_x, double right_x, int power=2)
- bool [auto_drive](#) (double inches, double direction, double speed, bool gyro_correction=true)
- bool [auto_turn](#) (double degrees, double speed, bool ignore_imu=false)

5.31.1 Detailed Description

A class representing the Mecanum drivetrain. Contains 4 motors, a possible IMU (inertial), and a possible undriven perpendicular wheel.

5.31.2 Constructor & Destructor Documentation

5.31.2.1 MecanumDrive()

```
MecanumDrive::MecanumDrive (
    vex::motor & left_front,
    vex::motor & right_front,
    vex::motor & left_rear,
    vex::motor & right_rear,
    vex::rotation * lateral_wheel = NULL,
    vex::inertial * imu = NULL,
    mecanumdrive\_config\_t * config = NULL )
```

Create the Mecanum drivetrain object

5.31.3 Member Function Documentation

5.31.3.1 auto_drive()

```
bool MecanumDrive::auto_drive (
    double inches,
    double direction,
    double speed,
    bool gyro_correction = true )
```

Drive the robot in a straight line automatically. If the inertial was declared in the constructor, use it to correct while driving. If the lateral wheel was declared in the constructor, use it for more accurate positioning while strafing.

Parameters

<i>inches</i>	How far the robot should drive, in inches
<i>direction</i>	What direction the robot should travel in, in degrees. 0 is forward, +/-180 is reverse, clockwise is positive.
<i>speed</i>	The maximum speed the robot should travel, in percent: -1.0->+1.0
<i>gyro_correction</i>	=true Whether or not to use the gyro to help correct while driving. Will always be false if no gyro was declared in the constructor.

Drive the robot in a straight line automatically. If the inertial was declared in the constructor, use it to correct while driving. If the lateral wheel was declared in the constructor, use it for more accurate positioning while strafing.

Parameters

<i>inches</i>	How far the robot should drive, in inches
<i>direction</i>	What direction the robot should travel in, in degrees. 0 is forward, +/-180 is reverse, clockwise is positive.
<i>speed</i>	The maximum speed the robot should travel, in percent: -1.0->+1.0
<i>gyro_correction</i>	= true Whether or not to use the gyro to help correct while driving. Will always be false if no gyro was declared in the constructor.

Returns

Whether or not the maneuver is complete.

5.31.3.2 auto_turn()

```
bool MecanumDrive::auto_turn (
    double degrees,
    double speed,
    bool ignore_imu = false )
```

Autonomously turn the robot X degrees over it's center point. Uses a closed loop for control.

Parameters

<i>degrees</i>	How many degrees to rotate the robot. Clockwise postive.
<i>speed</i>	What percentage to run the motors at: 0.0 -> 1.0
<i>ignore_imu</i>	=false Whether or not to use the Inertial for determining angle. Will instead use circumference formula + robot's wheelbase + encoders to determine.

Returns

whether or not the robot has finished the maneuver

Autonomously turn the robot X degrees over it's center point. Uses a closed loop for control.

Parameters

<i>degrees</i>	How many degrees to rotate the robot. Clockwise postive.
<i>speed</i>	What percentage to run the motors at: 0.0 -> 1.0
<i>ignore_imu</i>	= false Whether or not to use the Inertial for determining angle. Will instead use circumference formula + robot's wheelbase + encoders to determine.

Returns

whether or not the robot has finished the maneuver

5.31.3.3 drive()

```
void MecanumDrive::drive (
    double left_y,
    double left_x,
    double right_x,
    int power = 2 )
```

Drive the robot with a mecanum-style / arcade drive. Inputs are in percent (-100.0 -> 100.0) straight from the controller. Controls are mixed, so the robot can drive forward / strafe / rotate all at the same time.

Parameters

<i>left_y</i>	left joystick, Y axis (forward / backwards)
<i>left_x</i>	left joystick, X axis (strafe left / right)
<i>right↵ _x</i>	right joystick, X axis (rotation left / right)
<i>power</i>	=2 how much of a "curve" there should be on drive controls; better for low speed maneuvers. Leave blank for a default curve of 2 (higher means more fidelity)

Drive the robot with a mecanum-style / arcade drive. Inputs are in percent (-100.0 -> 100.0) straight from the controller. Controls are mixed, so the robot can drive forward / strafe / rotate all at the same time.

Parameters

<i>left_y</i>	left joystick, Y axis (forward / backwards)
<i>left_x</i>	left joystick, X axis (strafe left / right)
<i>right↵ _x</i>	right joystick, X axis (rotation left / right)
<i>power</i>	= 2 how much of a "curve" there should be on drive controls; better for low speed maneuvers. Leave blank for a default curve of 2 (higher means more fidelity)

5.31.3.4 drive_raw()

```
void MecanumDrive::drive_raw (
    double direction_deg,
    double magnitude,
    double rotation )
```

Drive the robot using vectors. This handles all the math required for mecanum control.

Parameters

<i>direction_deg</i>	the direction to drive the robot, in degrees. 0 is forward, 180 is back, clockwise is positive, counterclockwise is negative.
<i>magnitude</i>	How fast the robot should drive, in percent: 0.0->1.0
<i>rotation</i>	How fast the robot should rotate, in percent: -1.0->+1.0

The documentation for this class was generated from the following files:

- include/subsystems/mecanum_drive.h
- src/subsystems/mecanum_drive.cpp

5.32 MecanumDrive::mecanumdrive_config_t Struct Reference

```
#include <mecanum_drive.h>
```

Public Attributes

- [PID::pid_config_t](#) **drive_pid_conf**
- [PID::pid_config_t](#) **drive_gyro_pid_conf**
- [PID::pid_config_t](#) **turn_pid_conf**
- double **drive_wheel_diam**
- double **lateral_wheel_diam**
- double **wheelbase_width**

5.32.1 Detailed Description

Configure the Mecanum drive [PID](#) tunings and robot configurations

The documentation for this struct was generated from the following file:

- include/subsystems/mecanum_drive.h

5.33 motion_t Struct Reference

```
#include <trapezoid_profile.h>
```

Public Attributes

- double **pos**
1d position at this point in time
- double **vel**
1d velocity at this point in time
- double **accel**
1d acceleration at this point in time

5.33.1 Detailed Description

`motion_t` is a description of 1 dimensional motion at a point in time.

The documentation for this struct was generated from the following file:

- `include/utils/trapezoid_profile.h`

5.34 MotionController Class Reference

```
#include <motion_controller.h>
```

Inheritance diagram for MotionController:

Classes

- struct `m_profile_cfg_t`

Public Member Functions

- `MotionController` (`m_profile_cfg_t` &config)
Construct a new Motion Controller object.
- void `init` (double start_pt, double end_pt) override
Initialize the motion profile for a new movement This will also reset the [PID](#) and profile timers.
- double `update` (double sensor_val) override
Update the motion profile with a new sensor value.
- double `get` () override
- void `set_limits` (double lower, double upper) override
- bool `is_on_target` () override
- `motion_t get_motion` ()

Public Member Functions inherited from [Feedback](#)

- virtual `Feedback::FeedbackType get_type ()`

Static Public Member Functions

- static `FeedForward::ff_config_t tune_feedforward (TankDrive &drive, OdometryTank &odometry, double pct=0.6, double duration=2)`

Additional Inherited Members

Public Types inherited from [Feedback](#)

- enum `FeedbackType { PIDType , FeedforwardType , OtherType }`

5.34.1 Detailed Description

Motion Controller class

This class defines a top-level motion profile, which can act as an intermediate between a subsystem class and the motors themselves

This takes the constants kS, kV, kA, kP, kI, kD, max_v and acceleration and wraps around a feedforward, [PID](#) and trapezoid profile. It does so with the following formula:

```
out = feedforward.calculate(motion_profile.get(time_s)) + pid.get(motion_profile.get(time_s))
```

For [PID](#) and Feedforward specific formulae, see [pid.h](#), [feedforward.h](#), and [trapezoid_profile.h](#)

Author

Ryan McGee

Date

7/13/2022

5.34.2 Constructor & Destructor Documentation

5.34.2.1 MotionController()

```
MotionController::MotionController (
    m_profile_cfg_t & config )
```

Construct a new Motion Controller object.

Parameters

<i>config</i>	The definition of how the robot is able to move max_v Maximum velocity the movement is capable of accel Acceleration / deceleration of the movement pid_cfg Definitions of kP, kI, and kD ff_cfg Definitions of kS, kV, and kA
---------------	--

5.34.3 Member Function Documentation

5.34.3.1 get()

```
double MotionController::get ( ) [override], [virtual]
```

Returns

the last saved result from the feedback controller

Implements [Feedback](#).

5.34.3.2 get_motion()

```
motion_t MotionController::get_motion ( )
```

Returns

The current position, velocity and acceleration setpoints

5.34.3.3 init()

```
void MotionController::init (
    double start_pt,
    double end_pt ) [override], [virtual]
```

Initialize the motion profile for a new movement This will also reset the [PID](#) and profile timers.

Parameters

<i>start_pt</i>	Movement starting position
<i>end_pt</i>	Movement ending position

Implements [Feedback](#).

5.34.3.4 is_on_target()

```
bool MotionController::is_on_target ( ) [override], [virtual]
```

Returns

Whether or not the movement has finished, and the [PID](#) confirms it is on target

Implements [Feedback](#).

5.34.3.5 set_limits()

```
void MotionController::set_limits (
    double lower,
    double upper ) [override], [virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied. if limits are applied, the controller will not target any value below lower or above upper

Parameters

<i>lower</i>	upper limit
<i>upper</i>	lower limit

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

Parameters

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implements [Feedback](#).

5.34.3.6 tune_feedforward()

```
FeedForward::ff_config_t MotionController::tune_feedforward (
    TankDrive & drive,
    OdometryTank & odometry,
    double pct = 0.6,
    double duration = 2 ) [static]
```

This method attempts to characterize the robot's drivetrain and automatically tune the feedforward. It does this by first calculating the kS (voltage to overcome static friction) by slowly increasing the voltage until it moves.

Next is kV (voltage to sustain a certain velocity), where the robot will record it's steady-state velocity at 'pct' speed.

Finally, kA (voltage needed to accelerate by a certain rate), where the robot will record the entire movement's velocity and acceleration, record a plot of $[X=(pct-kV*V-kS), Y=(Acceleration)]$ along the movement, and since $kA*Accel = pct-kV*V-kS$, the reciprocal of the linear regression is the kA value.

Parameters

<i>drive</i>	The tankdrive to operate on
<i>odometry</i>	The robot's odometry subsystem
<i>pct</i>	Maximum velocity in percent (0->1.0)
<i>duration</i>	Amount of time the robot should be moving for the test

Returns

A tuned feedforward object

5.34.3.7 update()

```
double MotionController::update (
    double sensor_val ) [override], [virtual]
```

Update the motion profile with a new sensor value.

Parameters

<i>sensor_val</i>	Value from the sensor
-------------------	-----------------------

Returns

the motor input generated from the motion profile

Implements [Feedback](#).

The documentation for this class was generated from the following files:

- include/utils/motion_controller.h
- src/utils/motion_controller.cpp

5.35 MovingAverage Class Reference

```
#include <moving_average.h>
```

Public Member Functions

- [MovingAverage](#) (int buffer_size)
- [MovingAverage](#) (int buffer_size, double starting_value)
- void [add_entry](#) (double n)
- double [get_average](#) ()
- int [get_size](#) ()

5.35.1 Detailed Description[MovingAverage](#)

A moving average is a way of smoothing out noisy data. For many sensor readings, the noise is roughly symmetric around the actual value. This means that if you collect enough samples those that are too high are cancelled out by the samples that are too low leaving the real value.

The [MovingAverage](#) class provides a simple interface to do this smoothing from our noisy sensor values.

WARNING: because we need a lot of samples to get the actual value, the value given by the [MovingAverage](#) will 'lag' behind the actual value that the sensor is reading. Using a [MovingAverage](#) is thus a tradeoff between accuracy and lag time (more samples) vs. less accuracy and faster updating (less samples).

5.35.2 Constructor & Destructor Documentation

5.35.2.1 MovingAverage() [1/2]

```
MovingAverage::MovingAverage (
    int buffer_size )
```

Create a moving average calculator with 0 as the default value

Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
--------------------	---

5.35.2.2 MovingAverage() [2/2]

```
MovingAverage::MovingAverage (
    int buffer_size,
    double starting_value )
```

Create a moving average calculator with a specified default value

Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
<i>starting_value</i>	The value that the average will be before any data is added

5.35.3 Member Function Documentation

5.35.3.1 add_entry()

```
void MovingAverage::add_entry (
    double n )
```

Add a reading to the buffer Before: [1 1 2 2 3 3] => 2 ^ After: [2 1 2 2 3 3] => 2.16 ^

Parameters

<i>n</i>	the sample that will be added to the moving average.
----------	--

5.35.3.2 get_average()

```
double MovingAverage::get_average ( )
```

Returns the average based off of all the samples collected so far

Returns

the calculated average. `sum(samples)/numsamples`

How many samples the average is made from

Returns

the number of samples used to calculate this average

5.35.3.3 `get_size()`

```
int MovingAverage::get_size ( )
```

How many samples the average is made from

Returns

the number of samples used to calculate this average

The documentation for this class was generated from the following files:

- `include/utils/moving_average.h`
- `src/utils/moving_average.cpp`

5.36.1 Detailed Description

[Odometry3Wheel](#)

This class handles the code for a standard 3-pod odometry setup, where there are 3 "pods" made up of undriven (dead) wheels connected to encoders in the following configuration:

+Y ----- ^ || || || || || O || || || || || == | | ----- | +-----> + X

Where O is the center of rotation. The robot will monitor the changes in rotation of these wheels and calculate the robot's X, Y and rotation on the field.

This is a "set and forget" class, meaning once the object is created, the robot will immediately begin tracking it's movement in the background.

5.36.2 Constructor & Destructor Documentation

5.36.2.1 Odometry3Wheel()

```
Odometry3Wheel::Odometry3Wheel (
    CustomEncoder & lside_fwd,
    CustomEncoder & rside_fwd,
    CustomEncoder & off_axis,
    odometry3wheel_cfg_t & cfg,
    bool is_async = true )
```

Construct a new Odometry 3 Wheel object

Parameters

<i>lside_fwd</i>	left-side encoder reference
<i>rside_fwd</i>	right-side encoder reference
<i>off_axis</i>	off-axis (perpendicular) encoder reference
<i>cfg</i>	robot odometry configuration
<i>is_async</i>	true to constantly run in the background

5.36.3 Member Function Documentation

5.36.3.1 tune()

```
void Odometry3Wheel::tune (
    vex::controller & con,
    TankDrive & drive )
```

A guided tuning process to automatically find tuning parameters. This method is blocking, and returns when tuning has finished. Follow the instructions on the controller to complete the tuning process

Parameters

<i>con</i>	Controller reference, for screen and button control
<i>drive</i>	Drivetrain reference for robot control

A guided tuning process to automatically find tuning parameters. This method is blocking, and returns when tuning has finished. Follow the instructions on the controller to complete the tuning process

It is assumed the gear ratio and encoder PPR have been set correctly

5.36.3.2 update()

```
pose_t Odometry3Wheel::update ( ) [override], [virtual]
```

Update the current position of the robot once, using the current state of the encoders and the previous known location

Returns

the robot's updated position

Implements [OdometryBase](#).

The documentation for this class was generated from the following files:

- include/subsystems/odometry/odometry_3wheel.h

5.38.1 Detailed Description

OdometryBase

This base class contains all the shared code between different implementations of odometry. It handles the asynchronous management, position input/output and basic math functions, and holds positional types specific to field orientation.

All future odometry implementations should extend this file and redefine [update\(\)](#) function.

Author

Ryan McGee

Date

Aug 11 2021

5.38.2 Constructor & Destructor Documentation

5.38.2.1 OdometryBase()

```
OdometryBase::OdometryBase (
    bool is_async )
```

Construct a new Odometry Base object

Parameters

<i>is_async</i>	True to run constantly in the background, false to call update() manually
-----------------	---

5.38.3 Member Function Documentation

5.38.3.1 background_task()

```
int OdometryBase::background_task (
    void * ptr ) [static]
```

Function that runs in the background task. This function pointer is passed to the `vex::task` constructor.

Parameters

<i>ptr</i>	Pointer to OdometryBase object
------------	--

Returns

Required integer return code. Unused.

5.38.3.2 end_async()

```
void OdometryBase::end_async ( )
```

End the background task. Cannot be restarted. If the user wants to end the thread but keep the data up to date, they must run the [update\(\)](#) function manually from then on.

5.38.3.3 get_accel()

```
double OdometryBase::get_accel ( )
```

Get the current acceleration

Returns

the acceleration rate of the robot (inch/s²)

5.38.3.4 get_angular_accel_deg()

```
double OdometryBase::get_angular_accel_deg ( )
```

Get the current angular acceleration in degrees

Returns

the angular acceleration at which we are turning (deg/s²)

5.38.3.5 get_angular_speed_deg()

```
double OdometryBase::get_angular_speed_deg ( )
```

Get the current angular speed in degrees

Returns

the angular velocity at which we are turning (deg/s)

5.38.3.6 get_position()

```
pose_t OdometryBase::get_position (
    void )
```

Gets the current position and rotation

Returns

the position that the odometry believes the robot is at

Gets the current position and rotation

5.38.3.7 get_speed()

```
double OdometryBase::get_speed ( )
```

Get the current speed

Returns

the speed at which the robot is moving and grooving (inch/s)

5.38.3.8 pos_diff()

```
double OdometryBase::pos_diff (
    pose_t start_pos,
    pose_t end_pos ) [static]
```

Get the distance between two points

Parameters

<i>start_pos</i>	distance from this point
<i>end_pos</i>	to this point

Returns

the euclidean distance between start_pos and end_pos

5.38.3.9 rot_diff()

```
double OdometryBase::rot_diff (
    pose_t pos1,
    pose_t pos2 ) [static]
```

Get the change in rotation between two points

Parameters

<i>pos1</i>	position with initial rotation
<i>pos2</i>	position with final rotation

Returns

change in rotation between pos1 and pos2

Get the change in rotation between two points

5.38.3.10 `set_position()`

```
void OdometryBase::set_position (
    const pose\_t & newpos = zero\_pos ) [virtual]
```

Sets the current position of the robot

Parameters

<i>newpos</i>	the new position that the odometry will believe it is at
---------------	--

Sets the current position of the robot

Reimplemented in [OdometryTank](#).

5.38.3.11 `smallest_angle()`

```
double OdometryBase::smallest_angle (
    double start_deg,
    double end_deg ) [static]
```

Get the smallest difference in angle between a start heading and end heading. Returns the difference between -180 degrees and +180 degrees, representing the robot turning left or right, respectively.

Parameters

<i>start_deg</i>	intitial angle (degrees)
<i>end_deg</i>	final angle (degrees)

Returns

the smallest angle from the initial to the final angle. This takes into account the wrapping of rotations around 360 degrees

Get the smallest difference in angle between a start heading and end heading. Returns the difference between -180 degrees and +180 degrees, representing the robot turning left or right, respectively.

5.38.3.12 `update()`

```
virtual pose\_t OdometryBase::update ( ) [pure virtual]
```

Update the current position on the field based on the sensors

Returns

the location that the robot is at after the odometry does its calculations

Implemented in [Odometry3Wheel](#), and [OdometryTank](#).

5.38.4 Member Data Documentation

5.38.4.1 accel

`double OdometryBase::accel` [protected]

the rate at which we are accelerating (inch/s²)

5.38.4.2 ang_accel_deg

`double OdometryBase::ang_accel_deg` [protected]

the rate at which we are accelerating our turn (deg/s²)

5.38.4.3 ang_speed_deg

`double OdometryBase::ang_speed_deg` [protected]

the speed at which we are turning (deg/s)

5.38.4.4 current_pos

`pose_t OdometryBase::current_pos` [protected]

Current position of the robot in terms of x,y,rotation

5.38.4.5 handle

`vex::task* OdometryBase::handle` [protected]

handle to the vex task that is running the odometry code

5.38.4.6 mut

`vex::mutex OdometryBase::mut` [protected]

Mutex to control multithreading

5.38.4.7 speed

`double OdometryBase::speed` [protected]

the speed at which we are travelling (inch/s)

5.38.4.8 zero_pos

```
constexpr pose_t OdometryBase::zero_pos = {.x=0.0L, .y=0.0L, .rot=90.0L} [inline], [static],
[constexpr]
```

Zeroed position. X=0, Y=0, Rotation= 90 degrees

5.39.1 Detailed Description

[OdometryTank](#) defines an odometry system for a tank drivetrain. This requires encoders in the same orientation as the drive wheels. Odometry is a "start and forget" subsystem, which means once it's created and configured, it will constantly run in the background and track the robot's X, Y and rotation coordinates.

5.39.2 Constructor & Destructor Documentation

5.39.2.1 [OdometryTank\(\)](#) [1/3]

```
OdometryTank::OdometryTank (
    vex::motor_group & left_side,
    vex::motor_group & right_side,
    robot\_specs\_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true )
```

Initialize the Odometry module, calculating position from the drive motors.

Parameters

<i>left_side</i>	The left motors
<i>right_side</i>	The right motors
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See robot_specs_t for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call update() .

5.39.2.2 OdometryTank() [2/3]

```
OdometryTank::OdometryTank (
    CustomEncoder & left_custom_enc,
    CustomEncoder & right_custom_enc,
    robot_specs_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true )
```

Initialize the Odometry module, calculating position from the drive motors.

Parameters

<i>left_custom_enc</i>	The left custom encoder
<i>right_custom_enc</i>	The right custom encoder
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See robot_specs_t for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call update() .

5.39.2.3 OdometryTank() [3/3]

```
OdometryTank::OdometryTank (
    vex::encoder & left_vex_enc,
    vex::encoder & right_vex_enc,
    robot_specs_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true )
```

Initialize the Odometry module, calculating position from the drive motors.

Parameters

<i>left_vex_enc</i>	The left vex encoder
<i>right_vex_enc</i>	The right vex encoder
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See robot_specs_t for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call update() .

5.39.3 Member Function Documentation

5.39.3.1 set_position()

```
void OdometryTank::set_position (
    const pose\_t & newpos = zero\_pos ) [override], [virtual]
```

set_position tells the odometry to place itself at a position

Parameters

newpos	the position the odometry will take
------------------------	-------------------------------------

Resets the position and rotational data to the input.

Reimplemented from [OdometryBase](#).

5.39.3.2 update()

```
pose\_t OdometryTank::update ( ) [override], [virtual]
```

Update the current position on the field based on the sensors

Returns

the position that odometry has calculated itself to be at

Update, store and return the current position of the robot. Only use if not initializing with a separate thread.

Implements [OdometryBase](#).

The documentation for this class was generated from the following files:

- include/subsystems/odometry/odometry_tank.h
- src/subsystems/odometry/odometry_tank.cpp

5.40.1 Detailed Description

[AutoCommand](#) wrapper class for the [set_position](#) function in the [Odometry](#) class

5.40.2 Constructor & Destructor Documentation

5.40.2.1 OdomSetPosition()

```
OdomSetPosition::OdomSetPosition (
    OdometryBase & odom,
    const pose\_t & newpos = OdometryBase::zero\_pos )
```

constructs a new [OdomSetPosition](#) command

Parameters

<i>odom</i>	the odometry system we are setting
<i>newpos</i>	the position we are telling the odometry to take. defaults to (0, 0), angle = 90

Construct an Odometry set pos

Parameters

<i>odom</i>	the odometry system we are setting
<i>newpos</i>	the now position to set the odometry to

5.40.3 Member Function Documentation

5.40.3.1 run()

```
bool OdomSetPosition::run ( ) [override], [virtual]
```

Run set_position Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/drive_commands.h
- src/utils/command_structure/drive_commands.cpp

5.41 Parallel Class Reference

[Parallel](#) runs multiple commands in parallel and waits for all to finish before continuing. if none finish before this command's timeout, it will call on_timeout on all children continue.

Public Attributes

- [pid_config_t](#) & **config**

configuration struct for this controller. see [pid_config_t](#) for information about what this contains

5.43.1 Detailed Description

PID Class

Defines a standard feedback loop using the constants kP, kI, kD, deadband, and on_target_time. The formula is:

$$\text{out} = kP * \text{error} + kI * \text{integral}(\text{d Error}) + kD * (\text{dError}/\text{dt})$$

The PID object will determine it is "on target" when the error is within the deadband, for a duration of on_target_time

Author

Ryan McGee

Date

4/3/2020

5.43.2 Member Enumeration Documentation

5.43.2.1 ERROR_TYPE

```
enum PID::ERROR_TYPE
```

An enum to distinguish between a linear and angular caluclation of PID error.

5.43.3 Constructor & Destructor Documentation

5.43.3.1 PID()

```
PID::PID (
    pid_config_t & config )
```

Create the PID object

Parameters

<i>config</i>	the configuration data for this controller
---------------	--

Create the PID object

5.43.4 Member Function Documentation

5.43.4.1 get()

```
double PID::get ( ) [override], [virtual]
```

Gets the current PID out value, from when update() was last run

Returns

the Out value of the controller (voltage, RPM, whatever the [PID](#) controller is controlling)

Gets the current [PID](#) out value, from when [update\(\)](#) was last run

Implements [Feedback](#).

5.43.4.2 [get_error\(\)](#)

```
double PID::get_error ( )
```

Get the delta between the current sensor data and the target

Returns

the error calculated. how it is calculated depends on `error_method` specified in [pid_config_t](#)

Get the delta between the current sensor data and the target

5.43.4.3 [get_target\(\)](#)

```
double PID::get_target ( )
```

Get the [PID](#)'s target

Returns

the target the [PID](#) controller is trying to achieve

5.43.4.4 [get_type\(\)](#)

```
Feedback::FeedbackType PID::get_type ( ) [override], [virtual]
```

Reimplemented from [Feedback](#).

5.43.4.5 [init\(\)](#)

```
void PID::init (
    double start_pt,
    double set_pt ) [override], [virtual]
```

Inherited from [Feedback](#) for interoperability. Update the setpoint and reset integral accumulation

`start_pt` can be safely ignored in this feedback controller

Parameters

<i>start_</i> <i>_pt</i>	completely ignored for PID . necessary to satisfy Feedback base
<i>set_pt</i>	sets the target of the PID controller

Implements [Feedback](#).

5.43.4.6 is_on_target()

```
bool PID::is_on_target ( ) [override], [virtual]
```

Checks if the [PID](#) controller is on target.

Returns

true if the loop is within [deadband] for [on_target_time] seconds

Returns true if the loop is within [deadband] for [on_target_time] seconds

Implements [Feedback](#).

5.43.4.7 reset()

```
void PID::reset ( )
```

Reset the [PID](#) loop by resetting time since 0 and accumulated error.

5.43.4.8 set_limits()

```
void PID::set_limits (
    double lower,
    double upper ) [override], [virtual]
```

Set the limits on the [PID](#) out. The [PID](#) out will "clip" itself to be between the limits.

Parameters

<i>lower</i>	the lower limit. the PID controller will never command the output go below <i>lower</i>
<i>upper</i>	the upper limit. the PID controller will never command the output go higher than <i>upper</i>

Set the limits on the [PID](#) out. The [PID](#) out will "clip" itself to be between the limits.

Implements [Feedback](#).

5.43.4.9 set_target()

```
void PID::set_target (
    double target )
```

Set the target for the [PID](#) loop, where the robot is trying to end up

Parameters

<i>target</i>	the sensor reading we would like to achieve
---------------	---

Set the target for the [PID](#) loop, where the robot is trying to end up

5.43.4.10 update()

```
double PID::update (
    double sensor_val ) [override], [virtual]
```

Update the [PID](#) loop by taking the time difference from last update, and running the [PID](#) formula with the new sensor data

Parameters

<i>sensor_val</i>	the distance, angle, encoder position or whatever it is we are measuring
-------------------	--

Returns

the new output. What would be returned by [PID::get\(\)](#)

Implements [Feedback](#).

The documentation for this class was generated from the following files:

- include/utils/pid.h
- src/utils/pid.cpp

5.44 PID::pid_config_t Struct Reference

```
#include <pid.h>
```

Public Attributes

- double **p**
*proportional coefficient $p * error()$*
- double **i**
*integral coefficient $i * integral(error)$*
- double **d**

- derivative coefficient $d * derivative(error)$*
- double **deadband**
at what threshold are we close enough to be finished
- double **on_target_time**
the time in seconds that we have to be on target for to say we are officially at the target
- **ERROR_TYPE error_method**
Linear or angular. wheter to do error as a simple subtraction or to wrap.

5.44.1 Detailed Description

[pid_config_t](#) holds the configuration parameters for a pid controller In addition to the constant of proportional, integral and derivative, these parameters include:

- deadband -
- on_target_time - for how long do we have to be at the target to stop As well, [pid_config_t](#) holds an error type which determines whether errors should be calculated as if the sensor position is a measure of distance or an angle

The documentation for this struct was generated from the following file:

- include/utlis/pid.h

5.45 PIDFF Class Reference

Inheritance diagram for PIDFF:

Public Member Functions

Public Attributes

- [PID](#) pid

Additional Inherited Members**Public Types inherited from [Feedback](#)**

- enum **FeedbackType** { **PIDType** , **FeedforwardType** , **OtherType** }

5.45.1 Member Function Documentation**5.45.1.1 get()**

```
double PIDFF::get ( ) [override], [virtual]
```

Returns

the last saved result from the feedback controller

Implements [Feedback](#).

5.45.1.2 init()

```
void PIDFF::init (
    double start_pt,
    double set_pt ) [override], [virtual]
```

Initialize the feedback controller for a movement

Parameters

<i>start_pt</i>	the current sensor value
<i>set_pt</i>	where the sensor value should be

Implements [Feedback](#).

5.45.1.3 is_on_target()

```
bool PIDFF::is_on_target ( ) [override], [virtual]
```

Returns

true if the feedback controller has reached it's setpoint

Implements [Feedback](#).

5.45.1.4 set_limits()

```
void PIDFF::set_limits (
    double lower,
    double upper ) [override], [virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

Parameters

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implements [Feedback](#).

5.45.1.5 set_target()

```
void PIDFF::set_target (
    double set_pt )
```

Set the target of the [PID](#) loop

Parameters

<i>set_pt</i>	Setpoint / target value
---------------	-------------------------

5.45.1.6 update() [1/2]

```
double PIDFF::update (
    double val ) [override], [virtual]
```

Iterate the feedback loop once with an updated sensor value. Only kS for feedforward will be applied.

Parameters

<i>val</i>	value from the sensor
------------	-----------------------

Returns

feedback loop result

Implements [Feedback](#).

5.45.1.7 update() [2/2]

```
double PIDFF::update (
    double val,
```

```
double vel_setpt,
double a_setpt = 0 )
```

Iterate the feedback loop once with an updated sensor value

Parameters

<i>val</i>	value from the sensor
<i>vel_setpt</i>	Velocity for feedforward
<i>a_setpt</i>	Acceleration for feedforward

Returns

feedback loop result

The documentation for this class was generated from the following files:

- bool [operator==](#) (const [point_t](#) &rhs)

Public Attributes

- double **x**
the x position in space
- double **y**
the y position in space

5.46.1 Detailed Description

Data structure representing an X,Y coordinate

5.46.2 Member Function Documentation

5.46.2.1 dist()

```
double point_t::dist (
    const point\_t other ) const [inline]
```

dist calculates the euclidian distance between this point and another point using the pythagorean theorem

Parameters

<i>other</i>	the point to measure the distance from
--------------	--

Returns

the euclidian distance between this and other

5.46.2.2 operator+()

```
point_t point_t::operator+ (
    const point_t & other ) [inline]
```

[Vector2D](#) addition operation on points

Parameters

<i>other</i>	the point to add on to this
--------------	-----------------------------

Returns

this + other (this.x + other.x, this.y + other.y)

5.46.2.3 operator-()

```
point_t point_t::operator- (
    const point_t & other ) [inline]
```

[Vector2D](#) subtraction operation on points

Parameters

<i>other</i>	the point_t to subtract from this
--------------	---

Returns

this - other (this.x - other.x, this.y - other.y)

The documentation for this struct was generated from the following file:

Type dir, double radius, double max_speed=1)
- bool [run \(\)](#) override
- void [on_timeout \(\)](#) override

Public Member Functions inherited from [AutoCommand](#)

- [AutoCommand](#) * [withTimeout](#) (double t_seconds)

Additional Inherited Members

Public Attributes inherited from [AutoCommand](#)

- double `timeout_seconds` = `default_timeout`

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double `default_timeout` = 10.0

5.48.1 Detailed Description

Autocommand wrapper class for pure pursuit function in the [TankDrive](#) class

5.48.2 Constructor & Destructor Documentation

5.48.2.1 PurePursuitCommand()

```
PurePursuitCommand::PurePursuitCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    std::vector< point\_t > path,
    directionType dir,
    double radius,
    double max_speed = 1 )
```

Construct a Pure Pursuit [AutoCommand](#)

Parameters

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>radius</i>	How big the corner cutting should be - small values follow the path more closely
<i>feedback</i>	The feedback controller determining speed
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)

5.48.3 Member Function Documentation

5.48.3.1 on_timeout()

```
void PurePursuitCommand::on_timeout ( ) [override], [virtual]
```

Reset the drive system when it times out

Reimplemented from [AutoCommand](#).

5.48.3.2 run()

```
bool PurePursuitCommand::run ( ) [override], [virtual]
```

Direct call to [TankDrive::pure_pursuit](#)

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utils/command_structure/drive_commands.h
- src/utils/command_structure/drive_commands.cpp

5.49 robot_specs_t Struct Reference

```
#include <robot_specs.h>
```

Public Attributes

- double **robot_radius**
if you were to draw a circle with this radius, the robot would be entirely contained within it
- double **odom_wheel_diam**
the diameter of the wheels used for
- double **odom_gear_ratio**
the ratio of the odometry wheel to the encoder reading odometry data
- double **dist_between_wheels**
the distance between centers of the central drive wheels
- double **drive_correction_cutoff**
the distance at which to stop trying to turn towards the target. If we are less than this value, we can continue driving forward to minimize our distance but will not try to spin around to point directly at the target
- [Feedback](#) * **drive_feedback**
the default feedback for autonomous driving
- [Feedback](#) * **turn_feedback**
the default feedback for autonomous turning
- [PID::pid_config_t](#) **correction_pid**
the pid controller to keep the robot driving in as straight a line as possible

5.49.1 Detailed Description

Main robot characterization struct. This will be passed to all the major subsystems that require info about the robot. All distance measurements are in inches.

The documentation for this struct was generated from the following file:

- include/robot_specs.h

5.50 Serializer Class Reference

Serializes Arbitrary data to a file on the SD Card.

```
#include <serializer.h>
```

Public Member Functions

- **~Serializer ()**
Save and close upon destruction (bc of vex, this doesnt always get called when the program ends. To be sure, call save_to_disk)
- **Serializer (const std::string &filename, bool flush_always=true)**
create a [Serializer](#)
- void **save_to_disk () const**
saves current [Serializer](#) state to disk
- void **set_int (const std::string &name, int i)**
Setters - not saved until save_to_disk is called.
- void **set_bool (const std::string &name, bool b)**
sets a bool by the name of name to b. If flush_always == true, this will save to the sd card
- void **set_double (const std::string &name, double d)**
sets a double by the name of name to d. If flush_always == true, this will save to the sd card
- void **set_string (const std::string &name, std::string str)**
sets a string by the name of name to s. If flush_always == true, this will save to the sd card
- int **int_or (const std::string &name, int otherwise)**
gets a value stored in the serializer. If not found, sets the value to otherwise
- bool **bool_or (const std::string &name, bool otherwise)**
gets a value stored in the serializer. If not, sets the value to otherwise
- double **double_or (const std::string &name, double otherwise)**
gets a value stored in the serializer. If not, sets the value to otherwise
- std::string **string_or (const std::string &name, std::string otherwise)**
gets a value stored in the serializer. If not, sets the value to otherwise

5.50.1 Detailed Description

Serializes Arbitrary data to a file on the SD Card.

5.50.2 Constructor & Destructor Documentation

5.50.2.1 Serializer()

```
Serializer::Serializer (
    const std::string & filename,
    bool flush_always = true ) [inline], [explicit]
```

create a [Serializer](#)

Parameters

<i>filename</i>	the file to read from. If filename does not exist we will create that file
<i>flush_always</i>	If true, after every write flush to a file. If false, you are responsible for calling <code>save_to_disk</code>

5.50.3 Member Function Documentation

5.50.3.1 `bool_or()`

```
bool Serializer::bool_or (
    const std::string & name,
    bool otherwise )
```

gets a value stored in the serializer. If not, sets the value to otherwise

Parameters

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

Returns

the value if found or otherwise

5.50.3.2 `double_or()`

```
double Serializer::double_or (
    const std::string & name,
    double otherwise )
```

gets a value stored in the serializer. If not, sets the value to otherwise

Parameters

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

Returns

the value if found or otherwise

5.50.3.3 `int_or()`

```
int Serializer::int_or (
    const std::string & name,
    int otherwise )
```

gets a value stored in the serializer. If not found, sets the value to otherwise

Getters Return value if it exists in the serializer

Parameters

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

Returns

the value if found or otherwise

5.50.3.4 save_to_disk()

```
void Serializer::save_to_disk ( ) const
```

saves current [Serializer](#) state to disk

forms data bytes then saves to filename this was opened with

5.50.3.5 set_bool()

```
void Serializer::set_bool (
    const std::string & name,
    bool b )
```

sets a bool by the name of name to b. If flush_always == true, this will save to the sd card

Parameters

<i>name</i>	name of bool
<i>b</i>	value of bool

5.50.3.6 set_double()

```
void Serializer::set_double (
    const std::string & name,
    double d )
```

sets a double by the name of name to d. If flush_always == true, this will save to the sd card

Parameters

<i>name</i>	name of double
<i>d</i>	value of double

5.50.3.7 set_int()

```
void Serializer::set_int (
```

```
const std::string & name,  
int i )
```

Setters - not saved until `save_to_disk` is called.

sets an integer by the name of `name` to `i`. If `flush_always == true`, this will save to the sd card

Parameters

<i>name</i>	name of integer
<i>i</i>	value of integer

5.50.3.8 set_string()

```
void Serializer::set_string (  
    const std::string & name,  
    std::string str )
```

sets a string by the name of `name` to `s`. If `flush_always == true`, this will save to the sd card

Parameters

<i>name</i>	name of string
<i>i</i>	value of string

5.50.3.9 string_or()

```
std::string Serializer::string_or (  
    const std::string & name,  
    std::string otherwise )
```

gets a value stored in the serializer. If not, sets the value to `otherwise`

Parameters

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

Returns

the value if found or `otherwise`

The documentation for this class was generated from the following files:

- `include/utlis/serializer.h`
- `src/utlis/serializer.cpp`

5.51 SpinRPMCommand Class Reference

```
#include <flywheel_commands.h>
```

5.51.2 Constructor & Destructor Documentation

5.51.2.1 SpinRPMCommand()

```
SpinRPMCommand::SpinRPMCommand (
    Flywheel & flywheel,
    int rpm )
```

Construct a SpinRPM Command

Parameters

<i>flywheel</i>	the flywheel sys to command
<i>rpm</i>	the rpm that we should spin at

File: flywheel_commands.cpp Desc: [insert meaningful desc]

5.51.3 Member Function Documentation

5.51.3.1 run()

```
bool SpinRPMCommand::run ( ) [override], [virtual]
```

Run spin_manual Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/utls/command_structure/flywheel_commands.h
- src/utls/command_structure/flywheel_commands.cpp

5.52 PurePursuit::spline Struct Reference

```
#include <pure_pursuit.h>
```

Public Member Functions

- double **getY** (double x)

Public Attributes

- double **a**
- double **b**
- double **c**
- double **d**
- double **x_start**
- double **x_end**

5.52.1 Detailed Description

Represents a piece of a cubic spline with $s(x) = a(x-x_i)^3 + b(x-x_i)^2 + c(x-x_i) + d$. The `x_start` and `x_end` shows where the equation is valid.

The documentation for this struct was generated from the following file:

- `include/utis/pure_pursuit.h`

5.53.1 Detailed Description

[TankDrive](#) is a class to run a tank drive system. A tank drive system, sometimes called differential drive, has a motor (or group of synchronized motors) on the left and right side

5.53.2 Constructor & Destructor Documentation

5.53.2.1 TankDrive()

```
TankDrive::TankDrive (
    motor_group & left_motors,
    motor_group & right_motors,
    robot_specs_t & config,
    OdometryBase * odom = NULL )
```

Create the [TankDrive](#) object

Parameters

<i>left_motors</i>	left side drive motors
<i>right_motors</i>	right side drive motors
<i>config</i>	the configuration specification defining physical dimensions about the robot. See robot_specs_t for more info
<i>odom</i>	an odometry system to track position and rotation. this is necessary to execute autonomous paths

5.53.3 Member Function Documentation

5.53.3.1 drive_arcade()

```
void TankDrive::drive_arcade (
    double forward_back,
    double left_right,
    int power = 1 )
```

Drive the robot using arcade style controls. *forward_back* controls the linear motion, *left_right* controls the turning.

forward_back and *left_right* are in "percent": -1.0 -> 1.0

Parameters

<i>forward_back</i>	the percent to move forward or backward
<i>left_right</i>	the percent to turn left or right
<i>power</i>	modifies the input velocities $\text{left}^{\text{power}}$, $\text{right}^{\text{power}}$

Drive the robot using arcade style controls. *forward_back* controls the linear motion, *left_right* controls the turning.

left_motors and *right_motors* are in "percent": -1.0 -> 1.0

5.53.3.2 drive_forward() [1/2]

```
bool TankDrive::drive_forward (
    double inches,
    directionType dir,
    double max_speed = 1 )
```

Autonomously drive the robot forward a certain distance

Parameters

<i>inches</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Autonomously drive the robot forward a certain distance

Parameters

<i>inches</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have finished driving to our point

5.53.3.3 drive_forward() [2/2]

```
bool TankDrive::drive_forward (
    double inches,
    directionType dir,
    Feedback & feedback,
    double max_speed = 1 )
```

Use odometry to drive forward a certain distance using a custom feedback controller

Returns whether or not the robot has reached it's destination.

Parameters

<i>inches</i>	the distance to drive forward
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the custom feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true when we have reached our target distance

Use odometry to drive forward a certain distance using a custom feedback controller

Returns whether or not the robot has reached it's destination.

Parameters

<i>inches</i>	the distance to drive forward
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the custom feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

5.53.3.4 drive_tank()

```
void TankDrive::drive_tank (
    double left,
    double right,
    int power = 1 )
```

Drive the robot using differential style controls. left_motors controls the left motors, right_motors controls the right motors.

left_motors and right_motors are in "percent": -1.0 -> 1.0

Parameters

<i>left</i>	the percent to run the left motors
<i>right</i>	the percent to run the right motors
<i>power</i>	modifies the input velocities $\text{left}^{\text{power}}$, $\text{right}^{\text{power}}$
<i>isdriver</i>	default false. if true uses motor percentage. if false uses plain percentage of maximum voltage

Drive the robot using differential style controls. left_motors controls the left motors, right_motors controls the right motors.

left_motors and right_motors are in "percent": -1.0 -> 1.0

5.53.3.5 drive_to_point() [1/2]

```
bool TankDrive::drive_to_point (
    double x,
    double y,
    vex::directionType dir,
    double max_speed = 1 )
```

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot. Here we use the default feedback controller from the drive_sys

Returns whether or not the robot has reached it's destination.

Parameters

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot. Here we use the default feedback controller from the drive_sys

Returns whether or not the robot has reached it's destination.

Parameters

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have reached our target point

5.53.3.6 drive_to_point() [2/2]

```
bool TankDrive::drive_to_point (
    double x,
    double y,
    vex::directionType dir,
    Feedback & feedback,
    double max_speed = 1 )
```

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot.

Returns whether or not the robot has reached it's destination.

Parameters

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot.

Returns whether or not the robot has reached it's destination.

Parameters

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have reached our target point

5.53.3.7 modify_inputs()

```
double TankDrive::modify_inputs (
    double input,
    int power = 2 ) [static]
```

Create a curve for the inputs, so that drivers have more control at lower speeds. Curves are exponential, with the default being squaring the inputs.

Parameters

<i>input</i>	the input before modification
<i>power</i>	the power to raise input to

Returns

$\text{input}^{\text{power}}$ (accounts for negative inputs and odd numbered powers)

Modify the inputs from the controller by squaring / cubing, etc Allows for better control of the robot at slower speeds

Parameters

<i>input</i>	the input signal -1 -> 1
<i>power</i>	the power to raise the signal to

Returns

$\text{input}^{\text{power}}$ accounting for any sign issues that would arise with this naive solution

5.53.3.8 pure_pursuit() [1/2]

```
bool TankDrive::pure_pursuit (
    std::vector< point_t > path,
    directionType dir,
```

```
double radius,
double max_speed = 1 )
```

Drive the robot autonomously using a pure-pursuit algorithm - Input path with a set of waypoints - the robot will attempt to follow the points while cutting corners (radius) to save time (compared to stop / turn / start)

Use the default drive feedback

Parameters

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>radius</i>	How big the corner cutting should be - small values follow the path more closely
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)

Returns

True when the path is complete

5.53.3.9 pure_pursuit() [2/2]

```
bool TankDrive::pure_pursuit (
    std::vector< point_t > path,
    directionType dir,
    double radius,
    Feedback & feedback,
    double max_speed = 1 )
```

Drive the robot autonomously using a pure-pursuit algorithm - Input path with a set of waypoints - the robot will attempt to follow the points while cutting corners (radius) to save time (compared to stop / turn / start)

Parameters

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>radius</i>	How big the corner cutting should be - small values follow the path more closely
<i>feedback</i>	The feedback controller determining speed
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)

Returns

True when the path is complete

5.53.3.10 reset_auto()

```
void TankDrive::reset_auto ( )
```

Reset the initialization for autonomous drive functions

5.53.3.11 stop()

```
void TankDrive::stop ( )
```

Stops rotation of all the motors using their "brake mode"

5.53.3.12 turn_degrees() [1/2]

```
bool TankDrive::turn_degrees (
    double degrees,
    double max_speed = 1 )
```

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent_speed (-1.0 -> 1.0)

Uses the default turning feedback of the drive system.

Parameters

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent_speed (-1.0 -> 1.0)

Uses the default turning feedback of the drive system.

Parameters

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we turned te target number of degrees

5.53.3.13 turn_degrees() [2/2]

```
bool TankDrive::turn_degrees (
    double degrees,
    Feedback & feedback,
    double max_speed = 1 )
```

Autonomously turn the robot X degrees counterclockwise (negative for clockwise), with a maximum motor speed of percent_speed (-1.0 -> 1.0)

Uses PID + Feedforward for it's control.

Parameters

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent_speed (-1.0 -> 1.0)

Uses the specified feedback for it's control.

Parameters

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have turned our target number of degrees

5.53.3.14 turn_to_heading() [1/2]

```
bool TankDrive::turn_to_heading (
    double heading_deg,
    double max_speed = 1 )
```

Turn the robot in place to an exact heading relative to the field. 0 is forward. Uses the default turn feedback of the drive system

Parameters

<i>heading_deg</i>	the heading to which we will turn
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Turn the robot in place to an exact heading relative to the field. 0 is forward. Uses the default turn feedback of the drive system

Parameters

<i>heading_deg</i>	the heading to which we will turn
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have reached our target heading

5.53.3.15 turn_to_heading() [2/2]

```
bool TankDrive::turn_to_heading (
    double heading_deg,
    Feedback & feedback,
    double max_speed = 1 )
```

Turn the robot in place to an exact heading relative to the field. 0 is forward.

Parameters

<i>heading_deg</i>	the heading to which we will turn
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Turn the robot in place to an exact heading relative to the field. 0 is forward.

Parameters

<i>heading_deg</i>	the heading to which we will turn
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Returns

true if we have reached our target heading

5.54 TrapezoidProfile Class Reference

```
#include <trapezoid_profile.h>
```

Public Member Functions

- [TrapezoidProfile](#) (double max_v, double accel)
Construct a new Trapezoid Profile object.
- [motion_t calculate](#) (double time_s)
Run the trapezoidal profile based on the time that's elapsed.
- void [set_endpts](#) (double start, double end)
- void [set_accel](#) (double accel)
- void [set_max_v](#) (double max_v)
- double [get_movement_time](#) ()

5.54.1 Detailed Description

Trapezoid Profile

This is a motion profile defined by an acceleration, maximum velocity, start point and end point. Using this information, a parametric function is generated, with a period of acceleration, constant velocity, and deceleration. The velocity graph looks like a trapezoid, giving it its name.

If the maximum velocity is set high enough, this will become a S-curve profile, with only acceleration and deceleration.

This class is designed for use in properly modelling the motion of the robots to create a feedforward and target for [PID](#). Acceleration and Maximum velocity should be measured on the robot and tuned down slightly to account for battery drop.

Here are the equations graphed for ease of understanding: <https://www.desmos.com/calculator/rkm3ivulyk>

Ryan McGee

Date

7/12/2022

5.54.2 Constructor & Destructor Documentation

5.54.2.1 TrapezoidProfile()

```
TrapezoidProfile::TrapezoidProfile (
    double max_v,
    double accel )
```

Construct a new Trapezoid Profile object.

Parameters

<i>max_v</i>	Maximum velocity the robot can run at
<i>accel</i>	Maximum acceleration of the robot

5.54.3 Member Function Documentation

5.54.3.1 calculate()

```
motion_t TrapezoidProfile::calculate (
    double time_s )
```

Run the trapezoidal profile based on the time that's elapsed.

Parameters

<i>time</i> ↔ _s	Time since start of movement
---------------------	------------------------------

Returns

[motion_t](#) Position, velocity and acceleration

5.54.3.2 `get_movement_time()`

```
double TrapezoidProfile::get_movement_time ( )
```

uses the kinematic equations to and specified accel and max_v to figure out how long moving along the profile would take

Returns

the time the path will take to travel

5.54.3.3 `set_accel()`

```
void TrapezoidProfile::set_accel (
    double accel )
```

`set_accel` sets the acceleration this profile will use (the left and right legs of the trapezoid)

Parameters

<i>accel</i>	the acceleration amount to use
--------------	--------------------------------

5.54.3.4 `set_endpts()`

```
void TrapezoidProfile::set_endpts (
    double start,
    double end )
```

`set_endpts` defines a start and end position

Parameters

<i>start</i>	the starting position of the path
<i>end</i>	the ending position of the path

5.54.3.5 set_max_v()

```
void TrapezoidProfile::set_max_v (
    double max_v )
```

sets the maximum velocity for the profile (the height of the top of the trapezoid)

Parameters

<i>max_v</i>	the maximum velocity the robot can travel at
--------------	--

5.55.1 Detailed Description

[AutoCommand](#) wrapper class for the turn_degrees function in the [TankDrive](#) class

5.55.2 Constructor & Destructor Documentation

5.55.2.1 TurnDegreesCommand()

```
TurnDegreesCommand::TurnDegreesCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double degrees,
    double max_speed = 1 )
```

Construct a [TurnDegreesCommand](#) Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the turn
<i>degrees</i>	how many degrees to rotate
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

5.55.3 Member Function Documentation

5.55.3.1 on_timeout()

```
void TurnDegreesCommand::on_timeout ( ) [override], [virtual]
```

Cleans up drive system if we time out before finishing

reset the drive system if we timeout

Reimplemented from [AutoCommand](#).

5.55.3.2 run()

```
bool TurnDegreesCommand::run ( ) [override], [virtual]
```

Run turn_degrees Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

5.56.1 Detailed Description

[AutoCommand](#) wrapper class for the [turn_to_heading\(\)](#) function in the [TankDrive](#) class

5.56.2 Constructor & Destructor Documentation

5.56.2.1 TurnToHeadingCommand()

```

TurnToHeadingCommand::TurnToHeadingCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double heading_deg,
    double max_speed = 1 )

```

Construct a [TurnToHeadingCommand](#) Command

Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>heading_deg</i>	the heading to turn to in degrees
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

5.56.3 Member Function Documentation**5.56.3.1 on_timeout()**

```
void TurnToHeadingCommand::on_timeout ( ) [override], [virtual]
```

Cleans up drive system if we time out before finishing

reset the drive system if we don't hit our target

Reimplemented from [AutoCommand](#).

5.56.3.2 run()

```
bool TurnToHeadingCommand::run ( ) [override], [virtual]
```

Run turn_to_heading Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

- [Vector2D](#) [operator-](#) (const [Vector2D](#) &other)

5.57.1 Detailed Description

[Vector2D](#) is an x,y pair Used to represent 2D locations on the field. It can also be treated as a direction and magnitude

5.57.2 Constructor & Destructor Documentation

5.57.2.1 [Vector2D\(\)](#) [1/2]

```
Vector2D::Vector2D (
    double dir,
    double mag )
```

Construct a vector object.

Parameters

<i>dir</i>	Direction, in radians. 'foward' is 0, clockwise positive when viewed from the top.
<i>mag</i>	Magnitude.

5.57.2.2 [Vector2D\(\)](#) [2/2]

```
Vector2D::Vector2D (
    point\_t p )
```

Construct a vector object from a cartesian point.

Parameters

<i>p</i>	point_t.x , point_t.y
----------	---

5.57.3 Member Function Documentation

5.57.3.1 `get_dir()`

```
double Vector2D::get_dir ( ) const
```

Get the direction of the vector, in radians. '0' is forward, clockwise positive when viewed from the top.

Use `r2d()` to convert.

Returns

the direction of the vector in radians

Get the direction of the vector, in radians. '0' is forward, clockwise positive when viewed from the top.

Use `r2d()` to convert.

5.57.3.2 `get_mag()`

```
double Vector2D::get_mag ( ) const
```

Returns

the magnitude of the vector

Get the magnitude of the vector

5.57.3.3 `get_x()`

```
double Vector2D::get_x ( ) const
```

Returns

the X component of the vector; positive to the right.

Get the X component of the vector; positive to the right.

5.57.3.4 `get_y()`

```
double Vector2D::get_y ( ) const
```

Returns

the Y component of the vector, positive forward.

Get the Y component of the vector, positive forward.

5.57.3.5 normalize()

```
Vector2D Vector2D::normalize ( )
```

Changes the magnitude of the vector to 1

Returns

the normalized vector

Changes the magnetude of the vector to 1

5.57.3.6 operator*()

```
Vector2D Vector2D::operator* (
    const double & x )
```

Scales a [Vector2D](#) by a scalar with the * operator

Parameters

<i>x</i>	the value to scale the vector by
----------	----------------------------------

Returns

the this [Vector2D](#) scaled by x

5.57.3.7 operator+()

```
Vector2D Vector2D::operator+ (
    const Vector2D & other )
```

Add the components of two vectors together [Vector2D](#) + [Vector2D](#) = (this.x + other.x, this.y + other.y)

Parameters

<i>other</i>	the vector to add to this
--------------	---------------------------

Returns

the sum of the vectors

5.57.3.8 operator-()

```
Vector2D Vector2D::operator- (
    const Vector2D & other )
```

Subtract the components of two vectors together [Vector2D](#) - [Vector2D](#) = (this.x - other.x, this.y - other.y)

Parameters

<i>other</i>	the vector to subtract from this
--------------	----------------------------------

Returns

the difference of the vectors

5.57.3.9 point()

```
point_t Vector2D::point ( )
```

Returns a point from the vector

Returns

the point represented by the vector

Convert a direction and magnitude representation to an x, y representation

Returns

the x, y representation of the vector

The documentation for this class was generated from the following files:

- include/utils/vector2d.h

- double [timeout_seconds](#) = default_timeout

Static Public Attributes inherited from [AutoCommand](#)

- static constexpr double [default_timeout](#) = 10.0

5.59.1 Detailed Description

[AutoCommand](#) that listens to the [Flywheel](#) and waits until it is at its target speed +/- the specified threshold

5.59.2 Constructor & Destructor Documentation

5.59.2.1 WaitUntilUpToSpeedCommand()

```
WaitUntilUpToSpeedCommand::WaitUntilUpToSpeedCommand (
    Flywheel & flywheel,
    int threshold_rpm )
```

Creat a [WaitUntilUpToSpeedCommand](#)

Parameters

<i>flywheel</i>	the flywheel system we are commanding
<i>threshold_rpm</i>	the threshold over and under the flywheel target RPM that we define to be acceptable

5.59.3 Member Function Documentation

5.59.3.1 run()

```
bool WaitUntilUpToSpeedCommand::run ( ) [override], [virtual]
```

Run spin_manual Overrides run from [AutoCommand](#)

Returns

true when execution is complete, false otherwise

Reimplemented from [AutoCommand](#).

The documentation for this class was generated from the following files:

- include/Utils/command_structure/flywheel_commands.h
- src/Utils/command_structure/flywheel_commands.cpp
