<b>4 Namespace Documentation</b>	<b>10</b>
4.1 VDB Namespace Reference . . . . .	10
4.1.1 Detailed Description . . . . .	10
4.1.2 Function Documentation . . . . .	10
<b>5 Class Documentation</b>	<b>11</b>
5.1 VDP::AbstractDevice Class Reference . . . . .	11
5.1.1 Detailed Description . . . . .	11
5.1.2 Constructor & Destructor Documentation . . . . .	11
5.1.3 Member Function Documentation . . . . .	11
5.2 Async Class Reference . . . . .	12
5.2.1 Detailed Description . . . . .	12
5.3 AutoChooser Class Reference . . . . .	12
5.3.1 Detailed Description . . . . .	13
5.3.2 Constructor & Destructor Documentation . . . . .	13
5.3.3 Member Function Documentation . . . . .	13
5.3.4 Member Data Documentation . . . . .	14
5.4 BasicSolenoidSet Class Reference . . . . .	14
5.4.1 Detailed Description . . . . .	14
5.4.2 Constructor & Destructor Documentation . . . . .	14
5.4.3 Member Function Documentation . . . . .	15
5.5 BasicSpinCommand Class Reference . . . . .	15
5.5.1 Detailed Description . . . . .	15
5.5.2 Constructor & Destructor Documentation . . . . .	15
5.5.3 Member Function Documentation . . . . .	16
5.6 BasicStopCommand Class Reference . . . . .	16
5.6.1 Detailed Description . . . . .	16
5.6.2 Constructor & Destructor Documentation . . . . .	17
5.6.3 Member Function Documentation . . . . .	18
5.7 Branch Class Reference . . . . .	18
5.7.1 Detailed Description . . . . .	18
5.8 screen::ButtonWidget Class Reference . . . . .	19
5.8.1 Detailed Description . . . . .	19
5.8.2 Constructor & Destructor Documentation . . . . .	19

---

5.8.3 Member Function Documentation . . . . .	20
5.9 CommandController Class Reference . . . . .	20
5.9.1 Detailed Description . . . . .	21
5.9.2 Constructor & Destructor Documentation . . . . .	21
5.9.3 Member Function Documentation . . . . .	21
5.10 Condition Class Reference . . . . .	23
5.10.1 Detailed Description . . . . .	23
5.11 CRC32 Class Reference . . . . .	24
5.11.1 Detailed Description . . . . .	24
5.11.2 Member Function Documentation . . . . .	24
5.12 CustomEncoder Class Reference . . . . .	26
5.12.1 Detailed Description . . . . .	26
5.12.2 Constructor & Destructor Documentation . . . . .	26
5.12.3 Member Function Documentation . . . . .	26
5.13 DelayCommand Class Reference . . . . .	28
5.13.1 Detailed Description . . . . .	28
5.13.2 Constructor & Destructor Documentation . . . . .	28
5.13.3 Member Function Documentation . . . . .	29
5.14 DriveForwardCommand Class Reference . . . . .	29
5.14.1 Detailed Description . . . . .	29
5.14.2 Constructor & Destructor Documentation . . . . .	29
5.14.3 Member Function Documentation . . . . .	30
5.15 DriveStopCommand Class Reference . . . . .	30
5.15.1 Detailed Description . . . . .	30
5.15.2 Constructor & Destructor Documentation . . . . .	30
5.15.3 Member Function Documentation . . . . .	31
5.16 DriveToPointCommand Class Reference . . . . .	31
5.16.1 Detailed Description . . . . .	31
5.16.2 Constructor & Destructor Documentation . . . . .	31
5.16.3 Member Function Documentation . . . . .	32
5.17 AutoChooser::entry_t Struct Reference . . . . .	33
5.17.1 Detailed Description . . . . .	33
5.17.2 Member Data Documentation . . . . .	33
5.18 ExponentialMovingAverage Class Reference . . . . .	33
5.18.1 Detailed Description . . . . .	34
5.18.2 Constructor & Destructor Documentation . . . . .	34
5.18.3 Member Function Documentation . . . . .	34
5.19 Feedback Class Reference . . . . .	35
5.19.1 Detailed Description . . . . .	36
5.19.2 Member Function Documentation . . . . .	36
5.20 FeedForward Class Reference . . . . .	37
5.20.1 Detailed Description . . . . .	38

---

5.20.2 Constructor & Destructor Documentation . . . . .	38
5.20.3 Member Function Documentation . . . . .	38
5.21 FeedForward::ff_config_t Struct Reference . . . . .	39
5.21.1 Detailed Description . . . . .	39
5.21.2 Member Data Documentation . . . . .	39
5.22 Filter Class Reference . . . . .	40
5.22.1 Detailed Description . . . . .	40
5.23 Flywheel Class Reference . . . . .	40
5.23.1 Detailed Description . . . . .	41
5.23.2 Constructor & Destructor Documentation . . . . .	41
5.23.3 Member Function Documentation . . . . .	42
5.23.4 Friends And Related Symbol Documentation . . . . .	44
5.24 FlywheelStopCommand Class Reference . . . . .	44
5.24.1 Detailed Description . . . . .	44
5.24.2 Constructor & Destructor Documentation . . . . .	44
5.24.3 Member Function Documentation . . . . .	45
5.25 FlywheelStopMotorsCommand Class Reference . . . . .	45
5.25.1 Detailed Description . . . . .	45
5.25.2 Constructor & Destructor Documentation . . . . .	45
5.25.3 Member Function Documentation . . . . .	46
5.26 FlywheelStopNonTasksCommand Class Reference . . . . .	46
5.26.1 Detailed Description . . . . .	46
5.27 FunctionCommand Class Reference . . . . .	46
5.27.1 Detailed Description . . . . .	46
5.28 FunctionCondition Class Reference . . . . .	47
5.28.1 Detailed Description . . . . .	47
5.29 screen::FunctionPage Class Reference . . . . .	47
5.29.1 Detailed Description . . . . .	48
5.29.2 Constructor & Destructor Documentation . . . . .	48
5.29.3 Member Function Documentation . . . . .	48
5.30 GenericAuto Class Reference . . . . .	49
5.30.1 Detailed Description . . . . .	49
5.30.2 Member Function Documentation . . . . .	49
5.31 PurePursuit::hermite_point Struct Reference . . . . .	50
5.31.1 Detailed Description . . . . .	51
5.32 IfTimePassed Class Reference . . . . .	51
5.32.1 Detailed Description . . . . .	51
5.33 InOrder Class Reference . . . . .	51
5.33.1 Detailed Description . . . . .	51
5.34 InterpolatingMap< KEY, VALUE > Class Template Reference . . . . .	52
5.34.1 Detailed Description . . . . .	52
5.34.2 Member Function Documentation . . . . .	52

5.35 KalmanFilter< STATES, INPUTS, OUTPUTS > Class Template Reference . . . . .	53
5.35.1 Detailed Description . . . . .	53
5.35.2 Constructor & Destructor Documentation . . . . .	54
5.35.3 Member Function Documentation . . . . .	55
5.36 Lift< T > Class Template Reference . . . . .	57
5.36.1 Detailed Description . . . . .	58
5.36.2 Constructor & Destructor Documentation . . . . .	58
5.36.3 Member Function Documentation . . . . .	59
5.37 Lift< T >::lift_cfg_t Struct Reference . . . . .	62
5.37.1 Detailed Description . . . . .	62
5.38 LinearPlantInversionFeedforward< STATES, INPUTS > Class Template Reference . . . . .	62
5.38.1 Detailed Description . . . . .	63
5.38.2 Constructor & Destructor Documentation . . . . .	63
5.38.3 Member Function Documentation . . . . .	64
5.39 LinearQuadraticRegulator< STATES, INPUTS > Class Template Reference . . . . .	66
5.39.1 Detailed Description . . . . .	67
5.39.2 Constructor & Destructor Documentation . . . . .	67
5.39.3 Member Function Documentation . . . . .	69
5.40 LinearSystem< STATES, INPUTS, OUTPUTS > Class Template Reference . . . . .	69
5.40.1 Detailed Description . . . . .	70
5.40.2 Constructor & Destructor Documentation . . . . .	70
5.40.3 Member Function Documentation . . . . .	70
5.41 Logger Class Reference . . . . .	72
5.41.1 Detailed Description . . . . .	73
5.41.2 Constructor & Destructor Documentation . . . . .	73
5.41.3 Member Function Documentation . . . . .	73
5.42 MotionController::m_profile_cfg_t Struct Reference . . . . .	75
5.42.1 Detailed Description . . . . .	75
5.43 StateMachine< System, IDType, Message, delay_ms, do_log >::MaybeMessage Class Reference . . . . .	75
5.43.1 Detailed Description . . . . .	76
5.43.2 Constructor & Destructor Documentation . . . . .	76
5.43.3 Member Function Documentation . . . . .	76
5.44 MecanumDrive Class Reference . . . . .	77
5.44.1 Detailed Description . . . . .	77
5.44.2 Constructor & Destructor Documentation . . . . .	77
5.44.3 Member Function Documentation . . . . .	77
5.45 MecanumDrive::mecanumdrive_config_t Struct Reference . . . . .	80
5.45.1 Detailed Description . . . . .	80
5.46 MotionController Class Reference . . . . .	80
5.46.1 Detailed Description . . . . .	81
5.46.2 Constructor & Destructor Documentation . . . . .	81
5.46.3 Member Function Documentation . . . . .	81

---

5.47 VDP::MotorDataRecord Class Reference . . . . .	84
5.47.1 Detailed Description . . . . .	84
5.47.2 Constructor & Destructor Documentation . . . . .	84
5.47.3 Member Function Documentation . . . . .	85
5.48 MovingAverage Class Reference . . . . .	85
5.48.1 Detailed Description . . . . .	85
5.48.2 Constructor & Destructor Documentation . . . . .	86
5.48.3 Member Function Documentation . . . . .	86
5.49 VDP::Number< NumT, schemaType > Class Template Reference . . . . .	87
5.49.1 Detailed Description . . . . .	88
5.49.2 Member Typedef Documentation . . . . .	88
5.49.3 Constructor & Destructor Documentation . . . . .	88
5.49.4 Member Function Documentation . . . . .	89
5.50 Odometry3Wheel Class Reference . . . . .	91
5.50.1 Detailed Description . . . . .	92
5.50.2 Constructor & Destructor Documentation . . . . .	92
5.50.3 Member Function Documentation . . . . .	92
5.51 Odometry3Wheel::odometry3wheel_cfg_t Struct Reference . . . . .	93
5.51.1 Detailed Description . . . . .	93
5.51.2 Member Data Documentation . . . . .	93
5.52 OdometryBase Class Reference . . . . .	94
5.52.1 Detailed Description . . . . .	95
5.52.2 Constructor & Destructor Documentation . . . . .	95
5.52.3 Member Function Documentation . . . . .	95
5.52.4 Member Data Documentation . . . . .	98
5.53 VDP::OdometryControlRecord Class Reference . . . . .	99
5.53.1 Detailed Description . . . . .	100
5.53.2 Constructor & Destructor Documentation . . . . .	100
5.53.3 Member Function Documentation . . . . .	101
5.54 VDP::OdometryDataRecord Class Reference . . . . .	101
5.54.1 Detailed Description . . . . .	102
5.54.2 Constructor & Destructor Documentation . . . . .	102
5.54.3 Member Function Documentation . . . . .	102
5.55 screen::OdometryPage Class Reference . . . . .	103
5.55.1 Detailed Description . . . . .	103
5.55.2 Constructor & Destructor Documentation . . . . .	103
5.55.3 Member Function Documentation . . . . .	104
5.56 OdometrySerial Class Reference . . . . .	104
5.56.1 Detailed Description . . . . .	105
5.56.2 Constructor & Destructor Documentation . . . . .	106
5.56.3 Member Function Documentation . . . . .	106
5.57 OdometryTank Class Reference . . . . .	109

5.57.1 Detailed Description . . . . .	110

# 1 Core

This is the host repository for the custom VEX libraries used by the RIT VEXU team

Automatically updated documentation is available at [here](#). There is also a downloadable [reference manual](#).

## 1.1 Getting Started

If you just want to start a project with Core, make a fork of the [Fork Template](#) and follow it's instructions.

To setup core for an existing project:

1. Create a new vex project (using the VSCode extension or other methods)
2. Initialize a git repository for the project
3. Execute `git subtree add --prefix=core https://github.com/RIT-VEX-U/← Core.git main`
4. Update the vex Makefile (or any other build system) to know about the core files (`core/src` for source files, `core/include` for headers) (See [here](#) for an example)
5. Enable `Eigen` (Latest supported version is 3.4.0):
  - `mkdir vendor`
  - `git submodule add https://gitlab.com/libeigen/eigen.git vendor/eigen`
  - `cd vendor/eigen`
  - `git checkout 3.4.0`
  - Add the following to the makefile to give Core access to the library: `INC += -Ivendor/eigen` (See [here](#) for an example)

If you only wish to use a single version of Core, you can simply clone `core/` into your project and add the core source and header files to your makefile.

## 1.2 Features

Here is the current feature list this repo provides:

Subsystems (See [Wiki/Subsystems](#)):

- Tank drivetrain (user control / autonomous)
- Mecanum drivetrain (user control / autonomous)
- Odometry
  - Tank (Differential)
  - N-Pod
- Flywheel
- Lift
- Custom encoders

Utilities (See [Wiki/Utilites](#)):

- PID controller
- FeedForward controller
- Trapezoidal motion profile controller
- Pure Pursuit
- Generic auto program builder
- Auto program UI selector
- Mathematical classes (Vector2D, Moving Average)

## 2 Hierarchical Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

<b>VDP::AbstractDevice</b>	<a href="#">11</a>
<b>Async</b>	<a href="#">12</a>
<b>BasicSolenoidSet</b>	<a href="#">14</a>
<b>BasicSpinCommand</b>	<a href="#">15</a>
<b>BasicStopCommand</b>	<a href="#">16</a>
<b>Branch</b>	<a href="#">18</a>

screen::ButtonWidget	19

## 3 Class Index

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

VDP::AbstractDevice	11
<b>Async</b> <b>Async</b> runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT	12
AutoChooser	12
BasicSolenoidSet	14
BasicSpinCommand	15
BasicStopCommand	16
Branch	
<b>Branch</b> chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO_CHOICE; any choice that is out of bounds set to NO_CHOICE	18
screen::ButtonWidget	
Widget that does something when you tap it. The function is only called once when you first tap it	19
CommandController	20
Condition	23
CRC32	
A class for calculating the <b>CRC32</b> checksum from arbitrary data	24
CustomEncoder	26

<b>DelayCommand</b>	28
<b>DriveForwardCommand</b>	29
<b>DriveStopCommand</b>	30
<b>DriveToPointCommand</b>	31
<b>AutoChooser::entry_t</b>	33
<b>ExponentialMovingAverage</b>	33
<b>Feedback</b>	35
<b>FeedForward</b>	37
<b>FeedForward::ff_config_t</b>	39
<b>Filter</b>	40
<b>Flywheel</b>	40
<b>FlywheelStopCommand</b>	44
<b>FlywheelStopMotorsCommand</b>	45
<b>FlywheelStopNonTasksCommand</b>	46
<b>FunctionCommand</b>	46
<b>FunctionCondition</b>	
<b>FunctionCondition</b> is a quick and dirty <b>Condition</b> to wrap some expression that should be evaluated at runtime	47
<b>screen::FunctionPage</b>	
Simple page that stores no internal data. the draw and update functions use only global data rather than storing anything	47
<b>GenericAuto</b>	49
<b>PurePursuit::hermite_point</b>	50
<b>IfTimePassed</b>	
<b>IfTimePassed</b> tests based on time since the command controller was constructed. Returns true if elapsed time > time_s	51
<b>InOrder</b>	
<b>InOrder</b> runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?	51
<b>InterpolatingMap&lt; KEY, VALUE &gt;</b>	52
<b>KalmanFilter&lt; STATES, INPUTS, OUTPUTS &gt;</b>	53
<b>Lift&lt; T &gt;</b>	57
<b>Lift&lt; T &gt;::lift_cfg_t</b>	62
<b>LinearPlantInversionFeedforward&lt; STATES, INPUTS &gt;</b>	62
<b>LinearQuadraticRegulator&lt; STATES, INPUTS &gt;</b>	66
<b>LinearSystem&lt; STATES, INPUTS, OUTPUTS &gt;</b>	69

<b>Logger</b>	
Class to simplify writing to files	72
<b>MotionController::m_profile_cfg_t</b>	75
<b>StateMachine&lt; System, IDType, Message, delay_ms, do_log &gt;::MaybeMessage</b>	
MaybeMessage a message of Message type or nothing	MaybeMessage m = {};
// empty	75
MaybeMessage m = Message::EnumField1	
<b>MecanumDrive</b>	77
<b>MecanumDrive::mecanumdrive_config_t</b>	80
<b>MotionController</b>	80
<b>VDP::MotorDataRecord</b>	84
<b>MovingAverage</b>	85
<b>VDP::Number&lt; NumT, schemaType &gt;</b>	87
<b>Odometry3Wheel</b>	91
<b>Odometry3Wheel::odometry3wheel_cfg_t</b>	93
<b>OdometryBase</b>	94
<b>VDP::OdometryControlRecord</b>	99
<b>VDP::OdometryDataRecord</b>	101
<b>screen::OdometryPage</b>	
Page that shows odometry position and rotation and a map (if an sd card with the file is on)	103
<b>OdometrySerial</b>	104
<b>OdometryTank</b>	109
<b>OdomSetPosition</b>	112
<b>VDP::PacketHeader</b>	113
<b>VDP::PacketWriter</b>	113
<b>screen::Page</b>	
Page describes one part of the screen slideshow	117
<b>Parallel</b>	
Parallel runs multiple commands in parallel and waits for all to finish before continuing. if none	
finish before this command's timeout, it will call on_timeout on all children continue	118
<b>VDP::Part</b>	118
<b>PurePursuit::Path</b>	122
<b>PID</b>	123
<b>PID::pid_config_t</b>	128
<b>VDP::PIDControlRecord</b>	129
<b>VDP::PIDDDataRecord</b>	131

<b>screen::PIDPage</b>	
<b>PIDPage</b> provides a way to tune a pid controller on the screen	133
<b>Pose2d</b>	134
<b>PurePursuitCommand</b>	141
<b>VDP::Record</b>	142
<b>Rect</b>	145
<b>VDP::RegistryListener&lt; MutexType &gt;</b>	145
<b>ResponsePacketVisitor</b>	147
<b>robot_specs_t</b>	151
<b>Rotation2d</b>	152
<b>ScaledSphericalSimplexSigmaPoints&lt; STATES &gt;</b>	158
<b>screen::ScreenData</b>	
Holds the data that will be passed to the screen thread you probably shouldnt have to use it	161
<b>Serializer</b>	
Serializes Arbitrary data to a file on the SD Card	161
<b>screen::SliderWidget</b>	
Widget that updates a double value. Updates by reference so watch out for race conditions cuz the screen stuff lives on another thread	165
<b>SpinRPMCommand</b>	167
<b>PurePursuit::spline</b>	168
<b>StateMachine&lt; System, IDType, Message, delay_ms, do_log &gt;::State</b>	168
<b>StateMachine&lt; System, IDType, Message, delay_ms, do_log &gt;</b>	
State Machine :)))))) A fun fun way of controlling stateful subsystems - used in the 2023-2024 Over Under game for our overly complex intake-cata subsystem (see there for an example) The statemachine runs in a background thread and a user thread can interact with it through current_state and send_message	169
<b>screen::StatsPage</b>	
Draws motor stats and battery stats to the screen	171
<b>VDP::String</b>	172
<b>TakeBackHalf</b>	
A velocity controller	175
<b>TankDrive</b>	178
<b>VDP::TestRecord</b>	187
<b>VDP::TimestampedRecord</b>	188
<b>tracking_wheel_cfg_t</b>	190
<b>Transform2d</b>	191
<b>Translation2d</b>	196

<a href="#">TrapezoidProfile</a>	204
<a href="#">TurnDegreesCommand</a>	206
<a href="#">TurnToHeadingCommand</a>	207
<a href="#">Twist2d</a>	209
<a href="#">UnscentedKalmanFilter&lt; STATES, INPUTS, OUTPUTS &gt;</a>	211
<a href="#">VDP::UpcastNumbersVisitor</a>	219
<a href="#">VDP::Visitor</a>	219
<a href="#">WaitUntilCondition</a>	
Waits until the condition is true	219
<a href="#">WaitUntilUpToSpeedCommand</a>	220

## 4 Namespace Documentation

### 4.1 VDB Namespace Reference

#### Functions

- `uint32_t time_ms ()`
- `void delay_ms (uint32_t ms)`

#### 4.1.1 Detailed Description

Defines a COBS Serial Device to transmit [VDB](#) data through

#### 4.1.2 Function Documentation

##### `delay_ms()`

```
void VDB::delay_ms (
    uint32_t ms)
```

delay for ms time

##### Parameters

<code>ms</code>	the ms to delay for
-----------------	---------------------

##### `time_ms()`

```
uint32_t VDB::time_ms ()
```

##### Returns

the time in ms of the bot since startup

## 5 Class Documentation

### 5.1 VDP::AbstractDevice Class Reference

```
#include <protocol.hpp>
```

#### Public Member Functions

- virtual bool `send_packet` (const VDP::Packet &packet)=0
- virtual void `register_receive_callback` (std::function< void(const VDP::Packet &packet)> callback)=0
- virtual `~AbstractDevice` ()

#### 5.1.1 Detailed Description

defines a generic device to transmit packets through

#### 5.1.2 Constructor & Destructor Documentation

##### `~AbstractDevice()`

```
VDP::AbstractDevice::~AbstractDevice () [virtual]
```

deleter for the device, used to delete it when it is no longer needed

#### 5.1.3 Member Function Documentation

##### `register_receive_callback()`

```
virtual void VDP::AbstractDevice::register_receive_callback (
    std::function< void(const VDP::Packet &packet)> callback) [pure virtual]
```

a callback to function that runs when a new packet is available

###### Parameters

<code>the</code>	function for the callback to call me when my ex-wife
------------------	--

##### `send_packet()`

```
virtual bool VDP::AbstractDevice::send_packet (
    const VDP::Packet & packet) [pure virtual]
```

Sends a packet over some transmission medium It is not specified how the packet reaches the partner The transmission medium and wire format are left to the user

**Parameters**

<i>packet</i>	the packet to send through the device
---------------	---------------------------------------

**Returns**

whether the packet was sent successfully or not

The documentation for this class was generated from the following files:

- protocol.hpp
- protocol.cpp

## 5.2 Async Class Reference

[Async](#) runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT.

```
#include <auto_command.h>
```

### 5.2.1 Detailed Description

[Async](#) runs a command asynchronously will simply let it go and never look back THIS HAS A VERY NICHE USE CASE. THINK ABOUT IF YOU REALLY NEED IT.

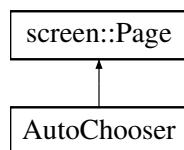

The documentation for this class was generated from the following files:

- auto\_command.h
- auto\_command.cpp

## 5.3 AutoChooser Class Reference

```
#include <auto_chooser.h>
```

Inheritance diagram for AutoChooser:

## Classes

- struct [entry\\_t](#)

## Public Member Functions

- `AutoChooser (std::vector< std::string > paths, size_t def=0)`
- `size_t get_choice ()`

## Protected Attributes

- `size_t choice`
- `std::vector< entry_t > list`

### 5.3.1 Detailed Description

Autochooser is a utility to make selecting robot autonomous programs easier source: RIT VexU Wiki During a season, we usually code between 4 and 6 autonomous programs. Most teams will change their entire robot program as a way of choosing autonomy but this may cause issues if you have an emergency patch to upload during a competition. This class was built as a way of using the robot screen to list autonomous programs, and the touchscreen to select them.

### 5.3.2 Constructor & Destructor Documentation

#### `AutoChooser()`

```
AutoChooser::AutoChooser (
    std::vector< std::string > paths,
    size_t def = 0)
```

Initialize the auto-chooser. This class places a choice menu on the brain screen, so the driver can choose which autonomous to run.

##### Parameters

<code>brain</code>	the brain on which to draw the selection boxes
--------------------	--

### 5.3.3 Member Function Documentation

#### `get_choice()`

```
size_t AutoChooser::get_choice ()
```

Get the currently selected auto choice

##### Returns

the identifier to the auto path

Return the selected autonomous

### 5.3.4 Member Data Documentation

#### choice

```
size_t AutoChooser::choice [protected]
```

the current choice of auto

#### list

```
std::vector<entry_t> AutoChooser::list [protected]
```

< a list of all possible auto choices

The documentation for this class was generated from the following files:

- `auto_chooser.h`
- `auto_chooser.cpp`

## 5.4 BasicSolenoidSet Class Reference

```
#include <basic_command.h>
```

### Public Member Functions

- [`BasicSolenoidSet`](#) (`vex::pneumatics &solenoid, bool setting`)  
*Construct a new `BasicSolenoidSet` Command.*
- `bool run () override`  
*Runs the `BasicSolenoidSet` Overrides run command from `AutoCommand`.*

### 5.4.1 Detailed Description

AutoCommand wrapper class for [`BasicSolenoidSet`](#) Using the Vex hardware functions

### 5.4.2 Constructor & Destructor Documentation

#### `BasicSolenoidSet()`

```
BasicSolenoidSet::BasicSolenoidSet (
    vex::pneumatics & solenoid,
    bool setting)
```

Construct a new [`BasicSolenoidSet`](#) Command.

**Parameters**

<i>solenoid</i>	Solenoid being set
<i>setting</i>	Setting of the solenoid in boolean (true,false)

**5.4.3 Member Function Documentation****run()**

```
bool BasicSolenoidSet::run () [override]
```

Runs the [BasicSolenoidSet](#) Overrides run command from AutoCommand.

**Returns**

True Command runs once

The documentation for this class was generated from the following files:

- basic\_command.h
- basic\_command.cpp

**5.5 BasicSpinCommand Class Reference**

```
#include <basic_command.h>
```

**Public Member Functions**

- [BasicSpinCommand](#) (vex::motor &motor, vex::directionType dir, BasicSpinCommand::type setting, double power)
   
*Construct a new BasicSpinCommand.*
- bool [run \(\)](#) override
   
*Runs the BasicSpinCommand Overrides run from Auto Command.*

**5.5.1 Detailed Description**

AutoCommand wrapper class for [BasicSpinCommand](#) using the vex hardware functions

**5.5.2 Constructor & Destructor Documentation****BasicSpinCommand()**

```
BasicSpinCommand::BasicSpinCommand (
    vex::motor & motor,
    vex::directionType dir,
    BasicSpinCommand::type setting,
    double power)
```

Construct a new [BasicSpinCommand](#).

a BasicMotorSpin Command

## Parameters

<i>motor</i>	Motor to spin
<i>direc</i>	Direction of motor spin
<i>setting</i>	Power setting in volts,percentage,velocity
<i>power</i>	Value of desired power
<i>motor</i>	Motor port to spin
<i>dir</i>	Direction for spinning
<i>setting</i>	Power setting in volts,percentage,velocity
<i>power</i>	Value of desired power

### 5.5.3 Member Function Documentation

#### run()

```
bool BasicSpinCommand::run () [override]
```

Runs the [BasicSpinCommand](#) Overrides run from Auto Command.

Run the [BasicSpinCommand](#) Overrides run from Auto Command.

#### Returns

True [Async](#) running command

True Command runs once

The documentation for this class was generated from the following files:

- basic\_command.h
- basic\_command.cpp

## 5.6 BasicStopCommand Class Reference

```
#include <basic_command.h>
```

### Public Member Functions

- [BasicStopCommand](#) (vex::motor &motor, vex::brakeType setting)  
*Construct a new BasicMotorStop Command.*
- bool [run \(\)](#) override  
*Runs the BasicMotorStop Command Overrides run command from AutoCommand.*

#### 5.6.1 Detailed Description

AutoCommand wrapper class for [BasicStopCommand](#) Using the Vex hardware functions

### 5.6.2 Constructor & Destructor Documentation

#### **BasicStopCommand()**

```
BasicStopCommand::BasicStopCommand (  
    vex::motor & motor,  
    vex::brakeType setting)
```

Construct a new BasicMotorStop Command.

Construct a BasicMotorStop Command.

**Parameters**

<i>motor</i>	The motor to stop
<i>setting</i>	The brake setting for the motor
<i>motor</i>	Motor to stop
<i>setting</i>	Braketype setting brake,coast,hold

### 5.6.3 Member Function Documentation

**run()**

```
bool BasicStopCommand::run () [override]
```

Runs the BasicMotorStop Command Overrides run command from AutoCommand.

Runs the BasicMotorStop command Overrides run command from AutoCommand.

**Returns**

True Command runs once

The documentation for this class was generated from the following files:

- basic\_command.h
- basic\_command.cpp

## 5.7 Branch Class Reference

[Branch](#) chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO\_CHOICE; any choice that is out of bounds set to NO\_CHOICE.

```
#include <auto_command.h>
```

### 5.7.1 Detailed Description

[Branch](#) chooses from multiple options at runtime. the function decider returns an index into the choices vector If you wish to make no choice and skip this section, return NO\_CHOICE; any choice that is out of bounds set to NO\_CHOICE.

The documentation for this class was generated from the following files:

- auto\_command.h
- auto\_command.cpp

## 5.8 screen::ButtonWidget Class Reference

Widget that does something when you tap it. The function is only called once when you first tap it.

```
#include <screen.h>
```

### Public Member Functions

- `ButtonWidget (std::function< void(void)> onpress, Rect rect, std::string name)`  
*Create a Button widget.*
- `ButtonWidget (void(*onpress)(), Rect rect, std::string name)`  
*Create a Button widget.*
- `bool update (bool was_pressed, int x, int y)`  
*responds to user input*
- `void draw (vex::brain::lcd &, bool first_draw, unsigned int frame_number)`  
*draws the button to the screen*

### 5.8.1 Detailed Description

Widget that does something when you tap it. The function is only called once when you first tap it.

### 5.8.2 Constructor & Destructor Documentation

#### ButtonWidget() [1/2]

```
screen::ButtonWidget::ButtonWidget (
    std::function< void(void)> onpress,
    Rect rect,
    std::string name) [inline]
```

Create a Button widget.

##### Parameters

<code>onpress</code>	the function to be called when the button is tapped
<code>rect</code>	the area the button should take up on the screen
<code>name</code>	the label put on the button

#### ButtonWidget() [2/2]

```
screen::ButtonWidget::ButtonWidget (
    void(* onpress )(),
    Rect rect,
    std::string name) [inline]
```

Create a Button widget.

**Parameters**

<i>onpress</i>	the function to be called when the button is tapped
<i>rect</i>	the area the button should take up on the screen
<i>name</i>	the label put on the button

### 5.8.3 Member Function Documentation

**update()**

```
bool screen::ButtonWidget::update (
    bool was_pressed,
    int x,
    int y)
```

responds to user input

**Parameters**

<i>was_pressed</i>	if the screen is pressed
<i>x</i>	x position if the screen was pressed
<i>y</i>	y position if the screen was pressed

**Returns**

true if the button was pressed

The documentation for this class was generated from the following files:

- screen.h
- screen.cpp

## 5.9 CommandController Class Reference

```
#include <command_controller.h>
```

**Public Member Functions**

- **CommandController ()**  
*Create an empty [CommandController](#). Add Command with [CommandController::add\(\)](#)*
- **CommandController (std::initializer\_list< AutoCommand \* > cmd)**  
*Create a [CommandController](#) with commands pre added. More can be added with [CommandController::add\(\)](#)*
- **void add (std::vector< AutoCommand \* > cmd)**
- **void add (AutoCommand \*cmd, double timeout\_seconds=10.0)**
- **void add (std::vector< AutoCommand \* > cmd, double timeout\_sec)**
- **void add\_delay (int ms)**
- **void add\_cancel\_func (std::function< bool(void)> true\_if\_cancel)**  
*add\_cancel\_func specifies that when this func evaluates to true, to cancel the command controller*
- **void run ()**
- **bool last\_command\_timed\_out ()**

### 5.9.1 Detailed Description

File: [command\\_controller.h](#) Desc: A [CommandController](#) manages the AutoCommands that make up an autonomous route. The AutoCommands are kept in a queue and get executed and removed from the queue in FIFO order.

### 5.9.2 Constructor & Destructor Documentation

#### [CommandController\(\)](#)

```
CommandController::CommandController (
    std::initializer_list< AutoCommand * > cmd) [inline]
```

Create a [CommandController](#) with commands pre added. More can be added with [CommandController::add\(\)](#)

##### Parameters

<i>cmds</i>	
-------------	--

### 5.9.3 Member Function Documentation

#### [add\(\) \[1/3\]](#)

```
void CommandController::add (
    AutoCommand * cmd,
    double timeout_seconds = 10.0)
```

File: [command\\_controller.cpp](#) Desc: A [CommandController](#) manages the AutoCommands that make up an autonomous route. The AutoCommands are kept in a queue and get executed and removed from the queue in FIFO order. Adds a command to the queue

##### Parameters

<i>cmd</i>	the AutoCommand we want to add to our list
<i>timeout_seconds</i>	the number of seconds we will let the command run for. If it exceeds this, we cancel it and run on_timeout

#### [add\(\) \[2/3\]](#)

```
void CommandController::add (
    std::vector< AutoCommand * > cmd)
```

Adds a command to the queue

##### Parameters

<i>cmd</i>	the AutoCommand we want to add to our list
<i>timeout_seconds</i>	the number of seconds we will let the command run for. If it exceeds this, we cancel it and run on_timeout. if it is <= 0 no time out will be applied

Add multiple commands to the queue. No timeout here.

**Parameters**

<i>cmds</i>	the AutoCommands we want to add to our list
-------------	---

**add() [3/3]**

```
void CommandController::add (
    std::vector< AutoCommand * > cmd,
    double timeout_sec)
```

Add multiple commands to the queue. No timeout here.

**Parameters**

<i>cmds</i>	the AutoCommands we want to add to our list Add multiple commands to the queue. No timeout here.
<i>cmds</i>	the AutoCommands we want to add to our list
<i>timeout_sec</i>	timeout in seconds to apply to all commands if they are still the default

Add multiple commands to the queue. No timeout here.

**Parameters**

<i>cmds</i>	the AutoCommands we want to add to our list
<i>timeout</i>	timeout in seconds to apply to all commands if they are still the default

**add\_cancel\_func()**

```
void CommandController::add_cancel_func (
    std::function< bool(void)> true_if_cancel)
```

add\_cancel\_func specifies that when this func evaluates to true, to cancel the command controller

**Parameters**

<i>true_if_cancel</i>	a function that returns true when we want to cancel the command controller
-----------------------	--

**add\_delay()**

```
void CommandController::add_delay (
    int ms)
```

Adds a command that will delay progression of the queue

**Parameters**

<i>ms</i>	- number of milliseconds to wait before continuing execution of autonomous
-----------	--

**last\_command\_timed\_out()**

```
bool CommandController::last_command_timed_out ()
```

`last_command_timed_out` tells how the last command ended Use this if you want to make decisions based on the end of the last command

**Returns**

true if the last command timed out. false if it finished regularly

**run()**

```
void CommandController::run ()
```

Begin execution of the queue Execute and remove commands in FIFO order

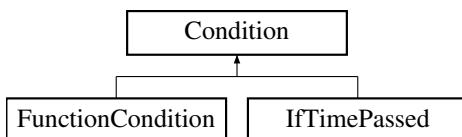

The documentation for this class was generated from the following files:

- `command_controller.h`
- `command_controller.cpp`

## 5.10 Condition Class Reference

```
#include <auto_command.h>
```

Inheritance diagram for Condition:

### 5.10.1 Detailed Description

File: [auto\\_command.h](#) Desc: Interface for module-specific commands A `Condition` is a function that returns true or false `is_even` is a predicate that would return true if a number is even For our purposes, a `Condition` is a choice to be made at runtime `drive_sys.reached_point(10, 30)` is a predicate `time.has_elapsed(10, vex::seconds)` is a predicate extend this class for different choices you wish to make

The documentation for this class was generated from the following files:

- `auto_command.h`
- `auto_command.cpp`

## 5.11 CRC32 Class Reference

A class for calculating the [CRC32](#) checksum from arbitrary data.

```
#include <crc32.hpp>
```

### Public Member Functions

- **CRC32 ()**  
*Initialize an empty CRC32 checksum.*
- **void reset ()**  
*Reset the checksum calculation.*
- **void update (const uint8\_t &data)**  
*Update the current checksum calculation with the given data.*
- template<typename Type>  
  **void update (const Type &data)**  
*Update the current checksum calculation with the given data.*
- template<typename Type>  
  **void update (const Type \*data, std::size\_t size)**  
*Update the current checksum calculation with the given data.*
- **uint32\_t finalize () const**

### Static Public Member Functions

- template<typename Type>  
  **static uint32\_t calculate (const Type \*data, std::size\_t size)**  
*Calculate the checksum of an arbitrary data array.*

#### 5.11.1 Detailed Description

A class for calculating the [CRC32](#) checksum from arbitrary data.

#### See also

<http://forum.arduino.cc/index.php?topic=91179.0>

#### 5.11.2 Member Function Documentation

##### **calculate()**

```
template<typename Type>
static uint32_t CRC32::calculate (
    const Type * data,
    std::size_t size) [inline], [static]
```

Calculate the checksum of an arbitrary data array.

**Parameters**

<i>Type</i>	The data type to read.
<i>data</i>	A pointer to the data to add to the checksum.
<i>size</i>	The size of the data to add to the checksum.

**Returns**

the calculated checksum.

**finalize()**

```
uint32_t CRC32::finalize () const
```

**Returns**

the calculated checksum.

**update() [1/3]**

```
template<typename Type>
void CRC32::update (
    const Type & data) [inline]
```

Update the current checksum calculation with the given data.

**Parameters**

<i>Type</i>	The data type to read.
<i>data</i>	The data to add to the checksum.

**update() [2/3]**

```
template<typename Type>
void CRC32::update (
    const Type * data,
    std::size_t size) [inline]
```

Update the current checksum calculation with the given data.

**Parameters**

<i>Type</i>	The data type to read.
<i>data</i>	The array to add to the checksum.
<i>size</i>	Size of the array to add.

**update() [3/3]**

```
void CRC32::update (
    const uint8_t & data)
```

Update the current checksum calculation with the given data.

**Parameters**

<i>data</i>	The data to add to the checksum.
-------------	----------------------------------

The documentation for this class was generated from the following files:

- crc32.hpp
- crc32.cpp

## 5.12 CustomEncoder Class Reference

```
#include <custom_encoder.h>
```

### Public Member Functions

- **CustomEncoder** (vex::triport::port &*port*, double *ticks\_per\_rev*)
- void **setRotation** (double *val*, vex::rotationUnits *units*)
- void **setPosition** (double *val*, vex::rotationUnits *units*)
- double **rotation** (vex::rotationUnits *units*)
- double **position** (vex::rotationUnits *units*)
- double **velocity** (vex::velocityUnits *units*)

### 5.12.1 Detailed Description

A wrapper class for the vex encoder that allows the use of 3rd party encoders with different tick-per-revolution values.

### 5.12.2 Constructor & Destructor Documentation

#### CustomEncoder()

```
CustomEncoder::CustomEncoder (
    vex::triport::port & port,
    double ticks_per_rev)
```

Construct an encoder with a custom number of ticks

**Parameters**

<i>port</i>	the triport port on the brain the encoder is plugged into
<i>ticks_per_rev</i>	the number of ticks the encoder will report for one revolution

### 5.12.3 Member Function Documentation

#### position()

```
double CustomEncoder::position (
    vex::rotationUnits units)
```

get the position that the encoder is at

**Parameters**

<i>units</i>	the unit we want the return value to be in
--------------	--

**Returns**

the position of the encoder in the units specified

**rotation()**

```
double CustomEncoder::rotation (
    vex::rotationUnits units)
```

get the rotation that the encoder is at

**Parameters**

<i>units</i>	the unit we want the return value to be in
--------------	--

**Returns**

the rotation of the encoder in the units specified

**setPosition()**

```
void CustomEncoder::setPosition (
    double val,
    vex::rotationUnits units)
```

sets the stored position of the encoder. Any further movements will be from this value

**Parameters**

<i>val</i>	the numerical value of the position we are setting to
<i>units</i>	the unit of val

**setRotation()**

```
void CustomEncoder::setRotation (
    double val,
    vex::rotationUnits units)
```

sets the stored rotation of the encoder. Any further movements will be from this value

**Parameters**

<i>val</i>	the numerical value of the angle we are setting to
<i>units</i>	the unit of val

**velocity()**

```
double CustomEncoder::velocity (
    vex::velocityUnits units)
```

get the velocity that the encoder is moving at

**Parameters**

<i>units</i>	the unit we want the return value to be in
--------------	--

**Returns**

the velocity of the encoder in the units specified

The documentation for this class was generated from the following files:

- custom\_encoder.h
- custom\_encoder.cpp

## 5.13 DelayCommand Class Reference

```
#include <delay_command.h>
```

**Public Member Functions**

- [DelayCommand](#) (int ms)
- bool [run \(\)](#) override

### 5.13.1 Detailed Description

File: [delay\\_command.h](#) Desc: A [DelayCommand](#) will make the robot wait the set amount of milliseconds before continuing execution of the autonomous route

### 5.13.2 Constructor & Destructor Documentation

#### **DelayCommand()**

```
DelayCommand::DelayCommand (
```

<i>int ms</i>	[inline]
---------------	----------

Construct a delay command

**Parameters**

<i>ms</i>	the number of milliseconds to delay for
-----------	---

### 5.13.3 Member Function Documentation

#### run()

```
bool DelayCommand::run () [inline], [override]
```

Delays for the amount of milliseconds stored in the command Overrides run from AutoCommand

#### Returns

true when complete

The documentation for this class was generated from the following file:

- delay\_command.h

## 5.14 DriveForwardCommand Class Reference

```
#include <drive_commands.h>
```

### Public Member Functions

- [DriveForwardCommand](#) ([TankDrive](#) &drive\_sys, [Feedback](#) &feedback, double inches, directionType dir, double max\_speed=1, double end\_speed=0)
- bool [run](#) () override
- void [on\\_timeout](#) () override

### 5.14.1 Detailed Description

AutoCommand wrapper class for the drive\_forward function in the [TankDrive](#) class

### 5.14.2 Constructor & Destructor Documentation

#### [DriveForwardCommand\(\)](#)

```
DriveForwardCommand::DriveForwardCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double inches,
    directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

File: [drive\\_commands.h](#) Desc: Holds all the AutoCommand subclasses that wrap (currently) [TankDrive](#) functions

Currently includes:

- [drive\\_forward](#)
- [turn\\_degrees](#)
- [drive\\_to\\_point](#)
- [turn\\_to\\_heading](#)
- [stop](#)

Also holds AutoCommand subclasses that wrap [OdometryBase](#) functions

Currently includes:

- [set\\_position](#) Construct a DriveForward Command

**Parameters**

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>inches</i>	how far forward to drive
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

**5.14.3 Member Function Documentation****on\_timeout()**

```
void DriveForwardCommand::on_timeout () [override]
```

Cleans up drive system if we time out before finishing

reset the drive system if we timeout

**run()**

```
bool DriveForwardCommand::run () [override]
```

Run drive\_forward Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- `drive_commands.h`
- `drive_commands.cpp`

**5.15 DriveStopCommand Class Reference**

```
#include <drive_commands.h>
```

**Public Member Functions**

- `DriveStopCommand (TankDrive &drive_sys)`
- `bool run () override`

**5.15.1 Detailed Description**

AutoCommand wrapper class for the stop() function in the `TankDrive` class

**5.15.2 Constructor & Destructor Documentation****DriveStopCommand()**

```
DriveStopCommand::DriveStopCommand (
    TankDrive & drive_sys)
```

Construct a DriveStop Command

**Parameters**

<code>drive_sys</code>	the drive system we are commanding
------------------------	------------------------------------

**5.15.3 Member Function Documentation****run()**

```
bool DriveStopCommand::run () [override]
```

Stop the drive system Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

Stop the drive train Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- `drive_commands.h`
- `drive_commands.cpp`

**5.16 DriveToPointCommand Class Reference**

```
#include <drive_commands.h>
```

**Public Member Functions**

- `DriveToPointCommand (TankDrive &drive_sys, Feedback &feedback, double x, double y, directionType dir, double max_speed=1, double end_speed=0)`
- `DriveToPointCommand (TankDrive &drive_sys, Feedback &feedback, Translation2d translation, directionType dir, double max_speed=1, double end_speed=0)`
- `bool run () override`

**5.16.1 Detailed Description**

AutoCommand wrapper class for the `drive_to_point` function in the `TankDrive` class

**5.16.2 Constructor & Destructor Documentation****DriveToPointCommand() [1/2]**

```
DriveToPointCommand::DriveToPointCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double x,
    double y,
    directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

Construct a DriveForward Command

**Parameters**

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>x</i>	where to drive in the x dimension
<i>y</i>	where to drive in the y dimension
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

**DriveToPointCommand() [2/2]**

```
DriveToPointCommand::DriveToPointCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    Translation2d translation,
    directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

Construct a DriveForward Command

**Parameters**

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the drive
<i>translation</i>	the point to drive to
<i>dir</i>	the direction to drive
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

### 5.16.3 Member Function Documentation

**run()**

```
bool DriveToPointCommand::run () [override]
```

Run drive\_to\_point Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- drive\_commands.h
- drive\_commands.cpp

## 5.17 AutoChooser::entry\_t Struct Reference

```
#include <auto_chooser.h>
```

### Public Attributes

- std::string [name](#)

#### 5.17.1 Detailed Description

[entry\\_t](#) is a datatype used to store information that the chooser knows about an auto selection button

#### 5.17.2 Member Data Documentation

##### [name](#)

```
std::string AutoChooser::entry_t::name
```

name of the auto represented by the block

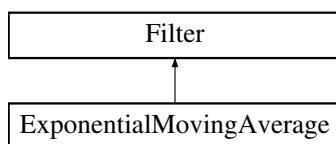

The documentation for this struct was generated from the following file:

- [auto\\_chooser.h](#)

## 5.18 ExponentialMovingAverage Class Reference

```
#include <moving_average.h>
```

Inheritance diagram for ExponentialMovingAverage:

### Public Member Functions

- [ExponentialMovingAverage](#) (int buffer\_size)
- [ExponentialMovingAverage](#) (int buffer\_size, double starting\_value)
- void [add\\_entry](#) (double n) override
- double [get\\_value](#) () const override
- int [get\\_size](#) ()

### 5.18.1 Detailed Description

#### ExponentialMovingAverage

An exponential moving average is a way of smoothing out noisy data. For many sensor readings, the noise is roughly symmetric around the actual value. This means that if you collect enough samples those that are too high are cancelled out by the samples that are too low leaving the real value.

A simple moving average lags significantly with time as it has to counteract old samples. An exponential moving average keeps more up to date by weighting newer readings higher than older readings so it is more up to date while also still smoothed.

The [ExponentialMovingAverage](#) class provides a simple interface to do this smoothing from our noisy sensor values.

### 5.18.2 Constructor & Destructor Documentation

#### ExponentialMovingAverage() [1/2]

```
ExponentialMovingAverage::ExponentialMovingAverage (
    int buffer_size)
```

Create a moving average calculator with 0 as the default value

##### Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
--------------------	---

#### ExponentialMovingAverage() [2/2]

```
ExponentialMovingAverage::ExponentialMovingAverage (
    int buffer_size,
    double starting_value)
```

Create a moving average calculator with a specified default value

##### Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
<i>starting_value</i>	The value that the average will be before any data is added

### 5.18.3 Member Function Documentation

#### add\_entry()

```
void ExponentialMovingAverage::add_entry (
    double n) [override], [virtual]
```

Add a reading to the buffer Before: [ 1 1 2 2 3 3 ] => 2 ^ After: [ 2 1 2 2 3 3 ] => 2.16 ^

**Parameters**

<code>n</code>	the sample that will be added to the moving average.
----------------	--

Implements [Filter](#).

**get\_size()**

```
int ExponentialMovingAverage::get_size ()
```

How many samples the average is made from

**Returns**

the number of samples used to calculate this average

**get\_value()**

```
double ExponentialMovingAverage::get_value () const [override], [virtual]
```

Returns the average based off of all the samples collected so far

**Returns**

the calculated average. sum(samples)/numsamples

How many samples the average is made from

**Returns**

the number of samples used to calculate this average

Implements [Filter](#).

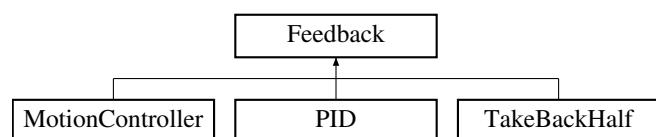

The documentation for this class was generated from the following files:

- `moving_average.h`
- `moving_average.cpp`

## 5.19 Feedback Class Reference

```
#include <feedback_base.h>
```

Inheritance diagram for Feedback:

## Public Member Functions

- virtual void `init` (double `start_pt`, double `set_pt`)=0
- virtual double `update` (double `val`)=0
- virtual double `get` ()=0
- virtual void `set_limits` (double `lower`, double `upper`)=0
- virtual bool `is_on_target` ()=0

### 5.19.1 Detailed Description

Interface so that subsystems can easily switch between feedback loops

#### Author

Ryan McGee

#### Date

9/25/2022

### 5.19.2 Member Function Documentation

#### `get()`

```
virtual double Feedback::get () [pure virtual]
```

#### Returns

the last saved result from the feedback controller

Implemented in [MotionController](#), [PID](#), and [TakeBackHalf](#).

#### `init()`

```
virtual void Feedback::init (
    double start_pt,
    double set_pt) [pure virtual]
```

Initialize the feedback controller for a movement

#### Parameters

<code>start_pt</code>	the current sensor value
<code>set_pt</code>	where the sensor value should be
<code>start_vel</code>	Movement starting velocity
<code>end_vel</code>	Movement ending velocity

Implemented in [MotionController](#), [PID](#), and [TakeBackHalf](#).

**is\_on\_target()**

```
virtual bool Feedback::is_on_target () [pure virtual]
```

**Returns**

true if the feedback controller has reached it's setpoint

Implemented in [MotionController](#), [PID](#), and [TakeBackHalf](#).

**set\_limits()**

```
virtual void Feedback::set_limits (
    double lower,
    double upper) [pure virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

**Parameters**

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implemented in [MotionController](#), [PID](#), and [TakeBackHalf](#).

**update()**

```
virtual double Feedback::update (
    double val) [pure virtual]
```

Iterate the feedback loop once with an updated sensor value

**Parameters**

<i>val</i>	value from the sensor
------------	-----------------------

**Returns**

feedback loop result

Implemented in [MotionController](#), [PID](#), and [TakeBackHalf](#).

The documentation for this class was generated from the following file:

- [feedback\\_base.h](#)

## 5.20 FeedForward Class Reference

```
#include <feedforward.h>
```

## Classes

- struct `ff_config_t`

## Public Member Functions

- `FeedForward (ff_config_t &cfg)`
- double `calculate (double v, double a, double pid_ref=0.0)`  
*Perform the feedforward calculation.*

### 5.20.1 Detailed Description

#### FeedForward

Stores the feedforward constants, and allows for quick computation. Feedforward should be used in systems that require smooth precise movements and have high inertia, such as drivetrains and lifts.

This is best used alongside a `PID` loop, with the form: `output = pid.get() + feedforward.calculate(v, a);`

In this case, the feedforward does the majority of the heavy lifting, and the pid loop only corrects for inconsistencies

For information about tuning feedforward, I recommend looking at this post: <https://www.chiefdelphi.com/t/paper-frc-drivetrain-characterization/160915> (yes I know it's for FRC but trust me, it's useful)

#### Author

Ryan McGee

#### Date

6/13/2022

### 5.20.2 Constructor & Destructor Documentation

#### FeedForward()

```
FeedForward::FeedForward (
    ff_config_t & cfg) [inline]
```

Creates a `FeedForward` object.

#### Parameters

<code>cfg</code>	Configuration Struct for tuning
------------------	---------------------------------

### 5.20.3 Member Function Documentation

#### calculate()

```
double FeedForward::calculate (
    double v,
    double a,
    double pid_ref = 0.0) [inline]
```

Perform the feedforward calculation.

This calculation is the equation:  $F = kG + kS \cdot \text{sgn}(v) + kV \cdot v + kA \cdot a$

**Parameters**

<i>v</i>	Requested velocity of system
<i>a</i>	Requested acceleration of system

**Returns**

A feedforward that should closely represent the system if tuned correctly

The documentation for this class was generated from the following file:

- feedforward.h

## 5.21 FeedForward::ff\_config\_t Struct Reference

```
#include <feedforward.h>
```

**Public Attributes**

- double **kS**
- double **kV**
- double **kA**
- double **kG**

### 5.21.1 Detailed Description

**ff\_config\_t** holds the parameters to make the theoretical model of a real world system equation is of the form kS if the system is not stopped, 0 otherwise

- KV \* desired velocity
- kA \* desired acceleration
- kG

### 5.21.2 Member Data Documentation

**kA**

```
double FeedForward::ff_config_t::kA
```

**kA** - Acceleration coefficient: the power required to change the mechanism's speed. Multiplied by the requested acceleration.

**kG**

```
double FeedForward::ff_config_t::kG
```

**kG** - Gravity coefficient: only needed for lifts. The power required to overcome gravity and stay at steady state.

**kS**

```
double FeedForward::ff_config_t::kS
```

Coefficient to overcome static friction: the point at which the motor *starts* to move.

**kV**

```
double FeedForward::ff_config_t::kV
```

Velocity coefficient: the power required to keep the mechanism in motion. Multiplied by the requested velocity.

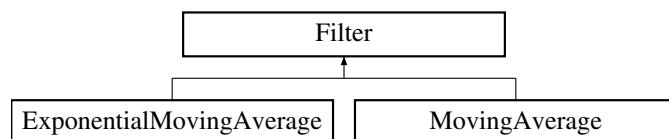

The documentation for this struct was generated from the following file:

- feedforward.h

## 5.22 Filter Class Reference

```
#include <moving_average.h>
```

Inheritance diagram for Filter:

### 5.22.1 Detailed Description

Interface for filters Use add\_entry to supply data and get\_value to retrieve the filtered value

The documentation for this class was generated from the following file:

- moving\_average.h

## 5.23 Flywheel Class Reference

```
#include <flywheel.h>
```

## Public Member Functions

- `Flywheel` (vex::motor\_group &motors, `Feedback` &feedback, `FeedForward` &helper, const double ratio, `Filter` &filt)
  - double `get_target` () const
  - double `getRPM` () const
  - vex::motor\_group & `get_motors` () const
  - void `spin_manual` (double speed, directionType dir=fwd)
  - void `spin_rpm` (double rpm)
  - void `stop` ()
  - bool `is_on_target` ()
    - check if the feedback controller thinks the flywheel is on target*
  - `screen::Page * Page` () const
    - Creates a page displaying info about the flywheel.*
  - AutoCommand \* `SpinRpmCmd` (int rpm)
    - Creates a new auto command to spin the flywheel at the desired velocity.*
  - AutoCommand \* `WaitUntilUpToSpeedCmd` ()
    - Creates a new auto command that will hold until the flywheel has its target as defined by its feedback controller.*

## Friends

- int `spinRPMTask` (void \*wheelPointer)

### 5.23.1 Detailed Description

a `Flywheel` class that handles all control of a high inertia spinning disk. It gives multiple options for what control system to use in order to control wheel velocity and functions alerting the user when the flywheel is up to speed. `Flywheel` is a set and forget class. Once you create it you can call `spin_rpm` or `stop` on it at any time and it will take all necessary steps to accomplish this

### 5.23.2 Constructor & Destructor Documentation

#### `Flywheel()`

```
Flywheel::Flywheel (
    vex::motor_group & motors,
    Feedback & feedback,
    FeedForward & helper,
    const double ratio,
    Filter & filt)
```

Create the `Flywheel` object using `PID` + feedforward for control.

#### Parameters

<code>motors</code>	pointer to the motors on the fly wheel
<code>feedback</code>	a feedback controller
<code>helper</code>	a feedforward config (only kV is used) to help the feedback controller along
<code>ratio</code>	ratio of the gears from the motor to the flywheel just multiplies the velocity
<code>filter</code>	the filter to use to smooth noisy motor readings

### 5.23.3 Member Function Documentation

#### **get\_motors()**

```
motor_group & Flywheel::get_motors () const
```

Returns the motors

Returns

the motors used to run the flywheel

#### **get\_target()**

```
double Flywheel::get_target () const
```

Return the target\_rpm that the flywheel is currently trying to achieve

Returns

target\_rpm the target rpm

Return the current value that the target\_rpm should be set to

#### **getRPM()**

```
double Flywheel::getRPM () const
```

return the velocity of the flywheel

#### **is\_on\_target()**

```
bool Flywheel::is_on_target () [inline]
```

check if the feedback controller thinks the flywheel is on target

Returns

true if on target

#### **Page()**

```
screen::Page * Flywheel::Page () const
```

Creates a page displaying info about the flywheel.

Returns

the page should be used for `screen::start\_screen(screen, {fw.Page()});`

#### **spin\_manual()**

```
void Flywheel::spin_manual (
    double speed,
    directionType dir = fwd)
```

Spin motors using voltage; defaults forward at 12 volts FOR USE BY OPCONTROL AND AUTONOMOUS - this only applies if the target\_rpm thread is not running

**Parameters**

<i>speed</i>	- speed (between -1 and 1) to set the motor
<i>dir</i>	- direction that the motor moves in; defaults to forward

Spin motors using voltage; defaults forward at 12 volts FOR USE BY OPCONTROL AND AUTONOMOUS - this only applies if the RPM thread is not running

**Parameters**

<i>speed</i>	- speed (between -1 and 1) to set the motor
<i>dir</i>	- direction that the motor moves in; defaults to forward

**spin\_rpm()**

```
void Flywheel::spin_rpm (
    double input_rpm)
```

starts or sets the target\_rpm thread at new value what control scheme is dependent on control\_style

**Parameters**

<i>rpm</i>	- the target_rpm we want to spin at
------------	-------------------------------------

starts or sets the RPM thread at new value what control scheme is dependent on control\_style

**Parameters**

<i>input_rpm</i>	- set the current RPM
------------------	-----------------------

**SpinRpmCmd()**

```
AutoCommand * Flywheel::SpinRpmCmd (
    int rpm) [inline]
```

Creates a new auto command to spin the flywheel at the desired velocity.

**Parameters**

<i>rpm</i>	the rpm to spin at
------------	--------------------

**Returns**

an auto command to add to a command controller

**stop()**

```
void Flywheel::stop ()
```

Stops the motors. If manually spinning, this will do nothing just call spin\_mainual(0.0) to send 0 volts stop the RPM thread and the wheel

**WaitUntilUpToSpeedCmd()**

```
AutoCommand * Flywheel::WaitUntilUpToSpeedCmd () [inline]
```

Creates a new auto command that will hold until the flywheel has its target as defined by its feedback controller.

**Returns**

an auto command to add to a command controller

#### 5.23.4 Friends And Related Symbol Documentation

**spinRPMTask**

```
int spinRPMTask (
    void * wheelPointer) [friend]
```

Runs a thread that keeps track of updating flywheel RPM and controlling it accordingly

The documentation for this class was generated from the following files:

- [flywheel.h](#)
- [flywheel.cpp](#)

### 5.24 FlywheelStopCommand Class Reference

```
#include <flywheel_commands.h>
```

**Public Member Functions**

- [FlywheelStopCommand \(Flywheel &flywheel\)](#)
- [bool run \(\) override](#)

#### 5.24.1 Detailed Description

AutoCommand wrapper class for the stop function in the [Flywheel](#) class

#### 5.24.2 Constructor & Destructor Documentation

**FlywheelStopCommand()**

```
FlywheelStopCommand::FlywheelStopCommand (
    Flywheel & flywheel)
```

Construct a [FlywheelStopCommand](#)

**Parameters**

<code>flywheel</code>	the flywheel system we are commanding
-----------------------	---------------------------------------

**5.24.3 Member Function Documentation****run()**

```
bool FlywheelStopCommand::run () [override]
```

Run stop Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- `flywheel_commands.h`
- `flywheel_commands.cpp`

**5.25 FlywheelStopMotorsCommand Class Reference**

```
#include <flywheel_commands.h>
```

**Public Member Functions**

- [FlywheelStopMotorsCommand \(Flywheel &flywheel\)](#)
- [bool run \(\) override](#)

**5.25.1 Detailed Description**

AutoCommand wrapper class for the stopMotors function in the [Flywheel](#) class

**5.25.2 Constructor & Destructor Documentation****FlywheelStopMotorsCommand()**

```
FlywheelStopMotorsCommand::FlywheelStopMotorsCommand (
```

```
    Flywheel & flywheel)
```

Construct a FlywheelStopMotors Command

**Parameters**

<i>flywheel</i>	the flywheel system we are commanding
-----------------	---------------------------------------

**5.25.3 Member Function Documentation****run()**

```
bool FlywheelStopMotorsCommand::run () [override]
```

Run stop Overrides run from AutoCommand

**Returns**

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- flywheel\_commands.h
- flywheel\_commands.cpp

**5.26 FlywheelStopNonTasksCommand Class Reference**

```
#include <flywheel_commands.h>
```

**5.26.1 Detailed Description**

AutoCommand wrapper class for the stopNonTasks function in the [Flywheel](#) class

The documentation for this class was generated from the following files:

- flywheel\_commands.h
- flywheel\_commands.cpp

**5.27 FunctionCommand Class Reference**

```
#include <auto_command.h>
```

**5.27.1 Detailed Description**

[FunctionCommand](#) is fun and good way to do simple things Printing, launching nukes, and other quick and dirty one time things

The documentation for this class was generated from the following file:

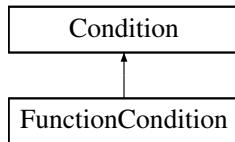

- auto\_command.h

## 5.28 FunctionCondition Class Reference

[FunctionCondition](#) is a quick and dirty [Condition](#) to wrap some expression that should be evaluated at runtime.

```
#include <auto_command.h>
```

Inheritance diagram for FunctionCondition:

### 5.28.1 Detailed Description

[FunctionCondition](#) is a quick and dirty [Condition](#) to wrap some expression that should be evaluated at runtime.

The documentation for this class was generated from the following files:

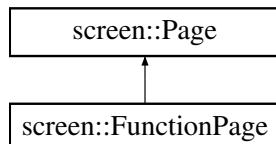

- [auto\\_command.h](#)
- [auto\\_command.cpp](#)

## 5.29 screen::FunctionPage Class Reference

Simple page that stores no internal data. the draw and update functions use only global data rather than storing anything.

```
#include <screen.h>
```

Inheritance diagram for screen::FunctionPage:

### Public Member Functions

- [FunctionPage](#) (`update_func_t update_f, draw_func_t draw_t`)
 

*Creates a function page.*
- void [update](#) (`bool was_pressed, int x, int y`) override
 

*update uses the supplied update function to update this page*
- void [draw](#) (`vex::brain::lcd &, bool first_draw, unsigned int frame_number`) override
 

*draw uses the supplied draw function to draw to the screen*

### 5.29.1 Detailed Description

Simple page that stores no internal data. the draw and update functions use only global data rather than storing anything.

### 5.29.2 Constructor & Destructor Documentation

#### **FunctionPage()**

```
screen::FunctionPage::FunctionPage (
    update_func_t update_f,
    draw_func_t draw_f)
```

Creates a function page.

[FunctionPage](#).

##### Parameters

<i>update_f</i>	the function called every tick to respond to user input or do data collection
<i>draw_t</i>	the function called to draw to the screen
<i>update_f</i>	drawing function
<i>draw_f</i>	drawing function

### 5.29.3 Member Function Documentation

#### **draw()**

```
void screen::FunctionPage::draw (
    vex::brain::lcd & screen,
    bool first_draw,
    unsigned int frame_number) [override], [virtual]
```

draw uses the supplied draw function to draw to the screen

##### See also

[Page::draw](#)

Reimplemented from [screen::Page](#).

### update()

```
void screen::FunctionPage::update (
    bool was_pressed,
    int x,
    int y) [override], [virtual]
```

update uses the supplied update function to update this page

#### See also

[Page::update](#)

Reimplemented from [screen::Page](#).

The documentation for this class was generated from the following files:

- screen.h
- screen.cpp

## 5.30 GenericAuto Class Reference

```
#include <generic_auto.h>
```

### Public Member Functions

- [bool run \(bool blocking\)](#)
- [void add \(state\\_ptr new\\_state\)](#)
- [void add\\_async \(state\\_ptr async\\_state\)](#)
- [void add\\_delay \(int ms\)](#)

#### 5.30.1 Detailed Description

[GenericAuto](#) provides a pleasant interface for organizing an auto path steps of the path can be added with [add\(\)](#) and when ready, calling [run\(\)](#) will begin executing the path

#### 5.30.2 Member Function Documentation

### add()

```
void GenericAuto::add (
    state_ptr new_state)
```

Add a new state to the autonomous via function point of type "bool (ptr\*)()"

#### Parameters

<i>new_state</i>	the function to run
------------------	---------------------

### add\_async()

```
void GenericAuto::add_async (
    state_ptr async_state)
```

Add a new state to the autonomous via function point of type "bool (ptr\*)()" that will run asynchronously

**Parameters**

<code>async_state</code>	the function to run
--------------------------	---------------------

**add\_delay()**

```
void GenericAuto::add_delay (
    int ms)
```

`add_delay` adds a period where the auto system will simply wait for the specified time

**Parameters**

<code>ms</code>	how long to wait in milliseconds
-----------------	----------------------------------

**run()**

```
bool GenericAuto::run (
    bool blocking)
```

The method that runs the autonomous. If 'blocking' is true, then this method will run through every state until it finished.

If blocking is false, then assuming every state is also non-blocking, the method will run through the current state in the list and return immediately.

**Parameters**

<code>blocking</code>	Whether or not to block the thread until all states have run
-----------------------	--

**Returns**

true after all states have finished.

The documentation for this class was generated from the following files:

- generic\_auto.h
- generic\_auto.cpp

## 5.31 PurePursuit::hermite\_point Struct Reference

```
#include <pure_pursuit.h>
```

### 5.31.1 Detailed Description

a position along the hermite path contains a position and orientation information that the robot would be at at this point

The documentation for this struct was generated from the following file:

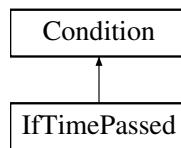

- pure\_pursuit.h

## 5.32 IfTimePassed Class Reference

IfTimePassed tests based on time since the command controller was constructed. Returns true if elapsed time > time\_s.

```
#include <auto_command.h>
```

Inheritance diagram for IfTimePassed:

### 5.32.1 Detailed Description

IfTimePassed tests based on time since the command controller was constructed. Returns true if elapsed time > time\_s.

The documentation for this class was generated from the following files:

- auto\_command.h
- auto\_command.cpp

## 5.33 InOrder Class Reference

InOrder runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?

```
#include <auto_command.h>
```

### 5.33.1 Detailed Description

InOrder runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?

InOrder runs its commands sequentially then continues. How to handle timeout in this case. Automatically set it to sum of commands timeouts?

The documentation for this class was generated from the following files:

- auto\_command.h
- auto\_command.cpp

## 5.34 InterpolatingMap< KEY, VALUE > Class Template Reference

```
#include <interpolating_map.h>
```

### Public Member Functions

- void `insert` (const KEY &key, const VALUE &value)
- VALUE `operator[]` (const KEY &key)
- void `clear` ()

#### 5.34.1 Detailed Description

```
template<typename KEY, typename VALUE>
class InterpolatingMap< KEY, VALUE >
```

This class implements a map of key-value pairs.

If there is not a pair with the given key in the map, the value will be a linear interpolation of the preceding and following values.

### Template Parameters

<code>KEY</code>	The type of the key.
<code>VALUE</code>	The type of the value.

#### 5.34.2 Member Function Documentation

##### `clear()`

```
template<typename KEY, typename VALUE>
void InterpolatingMap< KEY, VALUE >::clear () [inline]
```

Clears the contents of the map.

##### `insert()`

```
template<typename KEY, typename VALUE>
void InterpolatingMap< KEY, VALUE >::insert (
    const KEY & key,
    const VALUE & value) [inline]
```

Inserts a key value pair.

### Parameters

<code>key</code>	The key.
<code>value</code>	The value.

##### `operator[]()`

```
template<typename KEY, typename VALUE>
VALUE InterpolatingMap< KEY, VALUE >::operator[ ] (
    const KEY & key) [inline]
```

Obtains the value at the given key.

If the key does not exactly match a pair in the map, it will interpolate between the preceding and following pairs.

**Parameters**

<i>key</i>	The key.
------------	----------

**Returns**

The value.

The documentation for this class was generated from the following file:

- `interpolating_map.h`

## 5.35 KalmanFilter< STATES, INPUTS, OUTPUTS > Class Template Reference

```
#include <kalman_filter.h>
```

### Public Member Functions

- `KalmanFilter (LinearSystem< STATES, INPUTS, OUTPUTS > &plant, const StateVector &state_stddevs, const OutputVector &measurement_stddevs)`
- `KalmanFilter (const StateMatrix &A, const InputMatrix &B, const EMat< OUTPUTS, STATES > &C, const EMat< OUTPUTS, INPUTS > &D, const StateVector &state_stddevs, const OutputVector &measurement_stddevs)`
- `StateMatrix P () const`
- `void set_P (const StateMatrix &P)`
- `const StateVector & xhat () const`
- `double xhat (int i) const`
- `void set_xhat (const StateVector &xhat)`
- `void set_xhat (int i, double value)`
- `void reset ()`
- `void predict (const InputVector &u, const double &dt)`
- `void correct (const OutputVector &y, const InputVector &u)`
- `void correct (const OutputVector &y, const InputVector &u, const EMat< OUTPUTS, OUTPUTS > &R)`
- `template<int ROWS> void correct (const EVec< ROWS > &y, const InputVector &u, const EMat< ROWS, STATES > &C, const EMat< ROWS, INPUTS > &D, const EMat< ROWS, ROWS > &R)`

### 5.35.1 Detailed Description

```
template<int STATES, int INPUTS, int OUTPUTS>
class KalmanFilter< STATES, INPUTS, OUTPUTS >
```

Kalman filters combine predictions from a model and measurements to estimate a system's true state.

Each call of predict moves the state forward in time according to the matrix A, and the covariance has white noise Q added.

Each call of correct applies a measurement which moves the state more toward the true state, and it reduces the state covariance.

To read more about Kalman filters read: <https://github.com/rlabbe/Kalman-and-Bayesian-Filters-in-Python>

**Template Parameters**

<i>STATES</i>	Dimension of the state vector.
<i>INPUTS</i>	Dimension of the control input vector.
<i>OUTPUTS</i>	Dimension of the measurement vector.

**5.35.2 Constructor & Destructor Documentation****KalmanFilter() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
KalmanFilter< STATES, INPUTS, OUTPUTS >::KalmanFilter (
    LinearSystem< STATES, INPUTS, OUTPUTS > & plant,
    const StateVector & state_stddevs,
    const OutputVector & measurement_stddevs) [inline]
```

Constructs a Kalman filter.

**Parameters**

<i>plant</i>	The linear system the filter tracks.
<i>state_stddevs</i>	The standard deviations of the states.
<i>measurement_stddevs</i>	The standard deviations of the measurements.

**KalmanFilter() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
KalmanFilter< STATES, INPUTS, OUTPUTS >::KalmanFilter (
    const StateMatrix & A,
    const InputMatrix & B,
    const EMat< OUTPUTS, STATES > & C,
    const EMat< OUTPUTS, INPUTS > & D,
    const StateVector & state_stddevs,
    const OutputVector & measurement_stddevs) [inline]
```

Constructs a Kalman filter.

**Parameters**

<i>A</i>	The state matrix.
<i>B</i>	The input matrix.
<i>C</i>	The measurement matrix.
<i>D</i>	The feedthrough matrix.
<i>state_stddevs</i>	The standard deviations of the states.
<i>measurement_stddevs</i>	The standard deviations of the measurements.

### 5.35.3 Member Function Documentation

#### **correct()** [1/3]

```
template<int STATES, int INPUTS, int OUTPUTS>
template<int ROWS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const EVec< ROWS > & y,
    const InputVector & u,
    const EMat< ROWS, STATES > & C,
    const EMat< ROWS, INPUTS > & D,
    const EMat< ROWS, ROWS > & R) [inline]
```

Correct the state estimate using the measurements in  $y$ , custom measurement and feedthrough matrices, and custom measurement measurement noise. This is useful for when a different set of measurements are being applied than what the plant defines.

##### Parameters

$y$	The vector of measurements.
$u$	The control input used in the last predict step.
$C$	The measurement matrix to use for this step.
$D$	The feedthrough matrix to use for this step.
$R$	The measurement noise matrix to use for this step.

#### **correct()** [2/3]

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const OutputVector & y,
    const InputVector & u) [inline]
```

Correct the state estimate using the measurements in  $y$ .

##### Parameters

$y$	The vector of measurements.
$u$	The control input used in the last predict step.

#### **correct()** [3/3]

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const OutputVector & y,
    const InputVector & u,
    const EMat< OUTPUTS, OUTPUTS > & R) [inline]
```

Correct the state estimate using the measurements in  $y$ , and custom measurement noise matrix. This is useful for when the noise in the measurements vary.

**Parameters**

<i>y</i>	The vector of measurements.
<i>u</i>	The control input used in the last predict step.
<i>R</i>	The measurement noise matrix to use for this step.

**P()**

```
template<int STATES, int INPUTS, int OUTPUTS>
StateMatrix KalmanFilter< STATES, INPUTS, OUTPUTS >::P () const [inline]
```

Returns the covariance matrix P.

**predict()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::predict (
    const InputVector & u,
    const double & dt) [inline]
```

Projects the state into the future by dt seconds with control input u.

**Parameters**

<i>u</i>	The control input.
<i>dt</i>	The timestep in seconds.

**reset()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::reset () [inline]
```

Resets the filter.

**set\_P()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::set_P (
    const StateMatrix & P) [inline]
```

Set the current covariance matrix P.

**Parameters**

<i>P</i>	The covariance matrix P.
----------	--------------------------

**set\_xhat() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::set_xhat (
    const StateVector & xhat)  [inline]
```

Set the current state estimate x-hat.

**set\_xhat() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void KalmanFilter< STATES, INPUTS, OUTPUTS >::set_xhat (
    int i,
    double value)  [inline]
```

Set one element of the current state estimate x-hat.

**Parameters**

<i>i</i>	Row of x-hat.
----------	---------------

**xhat() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
const StateVector & KalmanFilter< STATES, INPUTS, OUTPUTS >::xhat () const  [inline]
```

Returns the current state estimate x-hat.

**xhat() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
double KalmanFilter< STATES, INPUTS, OUTPUTS >::xhat (
    int i) const  [inline]
```

Returns one element of the current state estimate x-hat.

**Parameters**

<i>i</i>	Row of x-hat.
----------	---------------

The documentation for this class was generated from the following file:

- kalman\_filter.h

## 5.36 Lift< T > Class Template Reference

```
#include <lift.h>
```

## Classes

- struct `lift_cfg_t`

## Public Member Functions

- `Lift` (`motor_group &lift_motors, lift_cfg_t &lift_cfg, map< T, double > &setpoint_map, limit *homing_switch=NULL)`
- `void control_continuous (bool up_ctrl, bool down_ctrl)`
- `void control_manual (bool up_btn, bool down_btn, int volt_up, int volt_down)`
- `void control_setpoints (bool up_step, bool down_step, vector< T > pos_list)`
- `bool set_position (T pos)`
- `bool set_setpoint (double val)`
- `double get_setpoint ()`
- `void hold ()`
- `void home ()`
- `bool get_async ()`
- `void set_async (bool val)`
- `void set_sensor_function (double(*fn_ptr)(void))`
- `void set_sensor_reset (void(*fn_ptr)(void))`

### 5.36.1 Detailed Description

```
template<typename T>
class Lift< T >
```

LIFT A general class for lifts (e.g. 4bar, dr4bar, linear, etc) Uses a `PID` to hold the lift at a certain height under load, and to move the lift to different heights

#### Author

Ryan McGee

### 5.36.2 Constructor & Destructor Documentation

#### `Lift()`

```
template<typename T>
Lift< T >::Lift (
    motor_group & lift_motors,
    lift_cfg_t & lift_cfg,
    map< T, double > & setpoint_map,
    limit * homing_switch = NULL) [inline]
```

Construct the `Lift` object and begin the background task that controls the lift.

Usage example: /code{.cpp} enum Positions {UP, MID, DOWN}; map<Positions, double> setpt\_map { {DOWN, 0.0}, {MID, 0.5}, {UP, 1.0} }; `Lift<Positions> my_lift(motors, lift_cfg, setpt_map);` /endcode

**Parameters**

<i>lift_motors</i>	A set of motors, all set that positive rotation correlates with the lift going up
<i>lift_cfg</i>	Lift characterization information; PID tunings and movement speeds
<i>setpoint_map</i>	A map of enum type T, in which each enum entry corresponds to a different lift height

**5.36.3 Member Function Documentation****control\_continuous()**

```
template<typename T>
void Lift< T >::control_continuous (
    bool up_ctrl,
    bool down_ctrl) [inline]
```

Control the lift with an "up" button and a "down" button. Use PID to hold the lift when letting go.

**Parameters**

<i>up_ctrl</i>	Button controlling the "UP" motion
<i>down_ctrl</i>	Button controlling the "DOWN" motion

**control\_manual()**

```
template<typename T>
void Lift< T >::control_manual (
    bool up_btn,
    bool down_btn,
    int volt_up,
    int volt_down) [inline]
```

Control the lift with manual controls (no holding voltage)

**Parameters**

<i>up_btn</i>	Raise the lift when true
<i>down_btn</i>	Lower the lift when true
<i>volt_up</i>	Motor voltage when raising the lift
<i>volt_down</i>	Motor voltage when lowering the lift

**control\_setpoints()**

```
template<typename T>
void Lift< T >::control_setpoints (
    bool up_step,
    bool down_step,
    vector< T > pos_list) [inline]
```

Control the lift in "steps". When the "up" button is pressed, the lift will go to the next position as defined by pos\_list. Order matters!

**Parameters**

<i>up_step</i>	A button that increments the position of the lift.
<i>down_step</i>	A button that decrements the position of the lift.
<i>pos_list</i>	A list of positions for the lift to go through. The higher the index, the higher the lift should be (generally).

**get\_async()**

```
template<typename T>
bool Lift< T >::get_async () [inline]
```

**Returns**

whether or not the background thread is running the lift

**get\_setpoint()**

```
template<typename T>
double Lift< T >::get_setpoint () [inline]
```

**Returns**

The current setpoint for the lift

**hold()**

```
template<typename T>
void Lift< T >::hold () [inline]
```

Target the class's setpoint. Calculate the [PID](#) output and set the lift motors accordingly.

**home()**

```
template<typename T>
void Lift< T >::home () [inline]
```

A blocking function that automatically homes the lift based on a sensor or hard stop, and sets the position to 0. A watchdog times out after 3 seconds, to avoid damage.

**set\_async()**

```
template<typename T>
void Lift< T >::set_async (
    bool val) [inline]
```

Enables or disables the background task. Note that running the control functions, or `set_position` functions will immediately re-enable the task for autonomous use.

**Parameters**

<i>val</i>	Whether or not the background thread should run the lift
------------	--

**set\_position()**

```
template<typename T>
bool Lift< T >::set_position (
    T pos) [inline]
```

Enable the background task, and send the lift to a position, specified by the setpoint map from the constructor.

**Parameters**

<i>pos</i>	A lift position enum type
------------	---------------------------

**Returns**

True if the pid has reached the setpoint

**set\_sensor\_function()**

```
template<typename T>
void Lift< T >::set_sensor_function (
    double(* fn_ptr )(void)) [inline]
```

Creates a custom hook for any other type of sensor to be used on the lift. Example: /code{.cpp} my\_lift.set\_sensor\_function( [](){return my\_sensor.position();} ); /endcode

**Parameters**

<i>fn_ptr</i>	Pointer to custom sensor function
---------------	-----------------------------------

**set\_sensor\_reset()**

```
template<typename T>
void Lift< T >::set_sensor_reset (
    void(* fn_ptr )(void)) [inline]
```

Creates a custom hook to reset the sensor used in [set\\_sensor\\_function\(\)](#). Example: /code{.cpp} my\_lift.set\_sensor\_reset( my\_sensor.resetPosition ); /endcode

**set\_setpoint()**

```
template<typename T>
bool Lift< T >::set_setpoint (
    double val) [inline]
```

Manually set a setpoint value for the lift [PID](#) to go to.

**Parameters**

<i>val</i>	<a href="#">Lift</a> setpoint, in motor revolutions or sensor units defined by <code>get_sensor</code> . Cannot be outside the softstops.
------------	---

**Returns**

True if the pid has reached the setpoint

The documentation for this class was generated from the following file:

- lift.h

## 5.37 Lift< T >::lift\_cfg\_t Struct Reference

```
#include <lift.h>
```

### 5.37.1 Detailed Description

```
template<typename T>
struct Lift< T >::lift_cfg_t
```

[lift\\_cfg\\_t](#) holds the physical parameter specifications of a lify system. includes:

- maximum speeds for the system
- softstops to stop the lift from hitting the hard stops too hard

The documentation for this struct was generated from the following file:

- lift.h

## 5.38 LinearPlantInversionFeedforward< STATES, INPUTS > Class Template Reference

```
#include <linear_plant_inversion_feedforward.h>
```

### Public Member Functions

- template<int OUTPUTS>  
  [LinearPlantInversionFeedforward](#) ([LinearSystem](#)< STATES, INPUTS, OUTPUTS > &plant, const double &dt)
- [LinearPlantInversionFeedforward](#) (const EMat< STATES, STATES > &A, const EMat< STATES, INPUTS > &B, const double &dt)
- EVec< INPUTS > [calculate](#) (const EVec< STATES > &r, const EVec< STATES > &next\_r)
- EVec< INPUTS > [calculate](#) (const EVec< STATES > &next\_r)
- EVec< INPUTS > [calculate](#) (const EVec< STATES > &r, const EVec< STATES > &next\_r, const double &dt)

- void [reset](#) (const EVec< STATES > &initial\_state)
- void [reset](#) ()
- void [set\\_r](#) (const EVec< STATES > &r)

### 5.38.1 Detailed Description

```
template<int STATES, int INPUTS>
class LinearPlantInversionFeedforward< STATES, INPUTS >
```

This class computes a feedforward control input by inverting the discrete plant dynamics. A continuous linear system is provided, it is then discretized on some timestep, then the feedforward control input is computed to satisfy:

$$B_d * u_{ff} = \text{next\_state} - A_d * \text{current\_state}$$

### 5.38.2 Constructor & Destructor Documentation

#### LinearPlantInversionFeedforward() [1/2]

```
template<int STATES, int INPUTS>
template<int OUTPUTS>
LinearPlantInversionFeedforward< STATES, INPUTS >::LinearPlantInversionFeedforward (
    LinearSystem< STATES, INPUTS, OUTPUTS > & plant,
    const double & dt) [inline]
```

Constructs a feedforward given a plant and the nominal timestep.

##### Template Parameters

<i>OUTPUTS</i>	The number of outputs of the plant.
----------------	-------------------------------------

##### Parameters

<i>plant</i>	The linear system.
<i>dt</i>	The nominal timestep in seconds.

#### LinearPlantInversionFeedforward() [2/2]

```
template<int STATES, int INPUTS>
LinearPlantInversionFeedforward< STATES, INPUTS >::LinearPlantInversionFeedforward (
    const EMat< STATES, STATES > & A,
    const EMat< STATES, INPUTS > & B,
    const double & dt) [inline]
```

Constructs a feedforward given the state and input matrices from a plant.

##### Parameters

<i>A</i>	The state matrix of the linear system.
<i>B</i>	The input matrix of the linear system.
<i>dt</i>	The nominal timestep in seconds.

### 5.38.3 Member Function Documentation

#### **calculate()** [1/4]

```
template<int STATES, int INPUTS>
EVec< INPUTS > LinearPlantInversionFeedforward< STATES, INPUTS >::calculate (
    const EVec< STATES > & next_r) [inline]
```

Computes the feedforward control input given only the next reference state. This assumes that the previous reference is already set.

**Parameters**

<i>next<sub>↔</sub> _r</i>	The next reference state.
--------------------------------	---------------------------

**calculate() [2/4]**

```
template<int STATES, int INPUTS>
EVec< INPUTS > LinearPlantInversionFeedforward< STATES, INPUTS >::calculate (
    const EVec< STATES > & next_r,
    const double & dt) [inline]
```

Computes the feedforward control input given only the next reference state. This assumes that the previous reference is already set.

This is slower because it discretizes A and B on each run, requiring computing a matrix exponential. Don't use this unless you have to.

**Parameters**

<i>next<sub>↔</sub> _r</i>	The next reference state.
<i>dt</i>	The timestep for this run.

**calculate() [3/4]**

```
template<int STATES, int INPUTS>
EVec< INPUTS > LinearPlantInversionFeedforward< STATES, INPUTS >::calculate (
    const EVec< STATES > & r,
    const EVec< STATES > & next_r) [inline]
```

Computes the feedforward control input given the current reference state and the next reference state. This also sets the current reference state to the next reference state for you.

**Parameters**

<i>r</i>	The current reference state.
<i>next<sub>↔</sub> _r</i>	The next reference state.

**calculate() [4/4]**

```
template<int STATES, int INPUTS>
EVec< INPUTS > LinearPlantInversionFeedforward< STATES, INPUTS >::calculate (
    const EVec< STATES > & r,
    const EVec< STATES > & next_r,
    const double & dt) [inline]
```

Computes the feedforward control input given the current reference state and the next reference state. This also sets the current reference state to the next reference state for you. Use this function if your timestep is not the same between each run.

This is slower because it discretizes A and B on each run, requiring computing a matrix exponential. Don't use this unless you have to.

**Parameters**

<i>r</i>	The current reference state.
<i>next<sub>←</sub></i>	The next reference state.
<i>_r</i>	

**reset() [1/2]**

```
template<int STATES, int INPUTS>
void LinearPlantInversionFeedforward< STATES, INPUTS >::reset () [inline]
```

Resets the reference to all zeros, and the feedforward to zero.

**reset() [2/2]**

```
template<int STATES, int INPUTS>
void LinearPlantInversionFeedforward< STATES, INPUTS >::reset (
    const EVec< STATES > & initial_state) [inline]
```

Resets the reference to the given state, and the feedforward to zero.

**Parameters**

<i>initial_state</i>	The state to set the current reference to.
----------------------	--

**set\_r()**

```
template<int STATES, int INPUTS>
void LinearPlantInversionFeedforward< STATES, INPUTS >::set_r (
    const EVec< STATES > & r) [inline]
```

Sets the current reference to a given state.

**Parameters**

<i>r</i>	The state to set the current reference to.
----------	--

## 5.39 LinearQuadraticRegulator< STATES, INPUTS > Class Template Reference

```
#include <linear_quadratic_regulator.h>
```

## Public Member Functions

- template<int OUTPUTS>  
`LinearQuadraticRegulator (LinearSystem< STATES, INPUTS, OUTPUTS > &plant, const VectorX &Qtolerances, const VectorU &Rtolerances, const double &dt)`
- `LinearQuadraticRegulator (const MatrixA &A, const MatrixB &B, const VectorX &Qtolerances, const VectorU &Rtolerances, const double &dt)`
- `LinearQuadraticRegulator (const MatrixA &A, const MatrixB &B, const EMat< STATES, STATES > &Q, const EMat< INPUTS, INPUTS > &R, const double &dt)`
- `VectorU calculate (const VectorX &x, const VectorX &r)`
- template<int OUTPUTS>  
`void latency_compensate (LinearSystem< STATES, INPUTS, OUTPUTS > &plant, const double &dt, const double &input_delay)`

### 5.39.1 Detailed Description

```
template<int STATES, int INPUTS>
class LinearQuadraticRegulator< STATES, INPUTS >
```

Class implements an LQR controller. This finds the optimal gain matrix K where:

$$u = K(r - x)$$

K is optimized to minimize a cost function:

$\infty$

$$J = \sum x_k^T Q x_k + u_k^T R u_k \quad k=0$$

Where Q and R are the state and control cost matrices.

#### Template Parameters

<code>STATES</code>	The number of states in the system.
<code>INPUTS</code>	The number of inputs to the system.

### 5.39.2 Constructor & Destructor Documentation

#### LinearQuadraticRegulator() [1/3]

```
template<int STATES, int INPUTS>
template<int OUTPUTS>
LinearQuadraticRegulator< STATES, INPUTS, OUTPUTS >::LinearQuadraticRegulator (
    LinearSystem< STATES, INPUTS, OUTPUTS > & plant,
    const VectorX & Qtolerances,
    const VectorU & Rtolerances,
    const double & dt) [inline]
```

Constructs an LQR given a plant, a vector of tolerances for the states and inputs, and the timestep in seconds.

**Template Parameters**

<i>OUTPUTS</i>	The number of outputs of the plant.
----------------	-------------------------------------

**Parameters**

<i>plant</i>	The linear system to control.
<i>Qtolerances</i>	A vector of tolerances for each state.
<i>Rtolerances</i>	A vector of tolerances for each input.

**LinearQuadraticRegulator() [2/3]**

```
template<int STATES, int INPUTS>
LinearQuadraticRegulator< STATES, INPUTS >::LinearQuadraticRegulator (
    const MatrixA & A,
    const MatrixB & B,
    const VectorX & Qtolerances,
    const VectorU & Rtolerances,
    const double & dt) [inline]
```

Constructs an LQR given state and input matrices, a vector of tolerances for the states and inputs, and the timestep in seconds.

**Parameters**

<i>A</i>	The state matrix of the linear system.
<i>B</i>	The input matrix of the linear system.
<i>Qtolerances</i>	A vector of tolerances for each state.
<i>Rtolerances</i>	A vector of tolerances for each input.

**LinearQuadraticRegulator() [3/3]**

```
template<int STATES, int INPUTS>
LinearQuadraticRegulator< STATES, INPUTS >::LinearQuadraticRegulator (
    const MatrixA & A,
    const MatrixB & B,
    const EMat< STATES, STATES > & Q,
    const EMat< INPUTS, INPUTS > & R,
    const double & dt) [inline]
```

Constructs an LQR given state and input matrices, the cost matrices of states and inputs, and the timestep in seconds.

**Parameters**

<i>A</i>	The state matrix of the linear system.
<i>B</i>	The input matrix of the linear system.
<i>Q</i>	The cost matrix of the states.
<i>R</i>	The cost matrix of the inputs.

### 5.39.3 Member Function Documentation

#### **calculate()**

```
template<int STATES, int INPUTS>
VectorU LinearQuadraticRegulator< STATES, INPUTS >::calculate (
    const VectorX & x,
    const VectorX & r) [inline]
```

Computes the control input u as:

$$u = K(r - x)$$

#### Parameters

x	The current state.
r	The reference state.

#### **latency\_compensate()**

```
template<int STATES, int INPUTS>
template<int OUTPUTS>
void LinearQuadraticRegulator< STATES, INPUTS >::latency_compensate (
    LinearSystem< STATES, INPUTS, OUTPUTS > & plant,
    const double & dt,
    const double & input_delay) [inline]
```

Recomputes K to work for a time delayed state.

$$K_{\text{delay}} = K(A - BK)^{\wedge}(\text{delay} / dt)$$

#### Template Parameters

OUTPUTS	The number of outputs of the plant
---------	------------------------------------

#### Parameters

plant	The linear system.
dt	The timestep in seconds.
input_delay	The time delay of the system.

The documentation for this class was generated from the following file:

- linear\_quadratic\_regulator.h

## 5.40 LinearSystem< STATES, INPUTS, OUTPUTS > Class Template Reference

```
#include <linear_system.h>
```

## Public Member Functions

- `LinearSystem` (`const MatrixA &A`, `const MatrixB &B`, `const MatrixC &C`, `const MatrixD &D`)
- `MatrixA A ()`
- `MatrixB B ()`
- `const std::tuple< std::tuple< MatrixA, MatrixB > > & discAB (const double &dt)`
- `MatrixC C ()`
- `MatrixD D ()`
- `VectorX compute_X (const VectorX &x, const VectorU &u, double dt)`
- `VectorY compute_Y (const VectorX &x, const VectorU &u)`

### 5.40.1 Detailed Description

```
template<int STATES, int INPUTS, int OUTPUTS>
class LinearSystem< STATES, INPUTS, OUTPUTS >
```

This class represents a state-space model of a linear system.

It contains the following continuous matrices: A, System matrix B, Input matrix C, Output matrix D, Feedthrough matrix

### 5.40.2 Constructor & Destructor Documentation

#### `LinearSystem()`

```
template<int STATES, int INPUTS, int OUTPUTS>
LinearSystem< STATES, INPUTS, OUTPUTS >::LinearSystem (
    const MatrixA & A,
    const MatrixB & B,
    const MatrixC & C,
    const MatrixD & D) [inline]
```

Constructs a discrete linear system with the given continuous matrices.

##### Parameters

<code>A</code>	The continuous system matrix
<code>B</code>	The continuous input matrix
<code>C</code>	The output matrix
<code>D</code>	The feedthrough matrix

### 5.40.3 Member Function Documentation

#### `A()`

```
template<int STATES, int INPUTS, int OUTPUTS>
MatrixA LinearSystem< STATES, INPUTS, OUTPUTS >::A () [inline]
```

Returns the continuous system matrix A.

**B()**

```
template<int STATES, int INPUTS, int OUTPUTS>
MatrixB LinearSystem< STATES, INPUTS, OUTPUTS >::B () [inline]
```

Returns the continuous input matrix B.

**C()**

```
template<int STATES, int INPUTS, int OUTPUTS>
MatrixC LinearSystem< STATES, INPUTS, OUTPUTS >::C () [inline]
```

Returns the output matrix C.

**compute\_X()**

```
template<int STATES, int INPUTS, int OUTPUTS>
VectorX LinearSystem< STATES, INPUTS, OUTPUTS >::compute\_X (
    const VectorX & x,
    const VectorU & u,
    double dt) [inline]
```

Computes the new state vector given the previous state vector, an input vector, and the timestep in seconds.

**Parameters**

<i>x</i>	The current state vector.
<i>u</i>	The input vector.
<i>dt</i>	The timestep in seconds.

**Returns**

The new state vector.

**compute\_Y()**

```
template<int STATES, int INPUTS, int OUTPUTS>
VectorY LinearSystem< STATES, INPUTS, OUTPUTS >::compute\_Y (
    const VectorX & x,
    const VectorU & u) [inline]
```

Computes the output vector given a state and an input.

**Parameters**

<i>x</i>	The state vector.
<i>u</i>	The input vector.

**Returns**

The output vector.

**D()**

```
template<int STATES, int INPUTS, int OUTPUTS>
MatrixD LinearSystem< STATES, INPUTS, OUTPUTS >::D () [inline]
```

Returns the feedthrough matrix D.

**discAB()**

```
template<int STATES, int INPUTS, int OUTPUTS>
const std::tuple< std::tuple< MatrixA, MatrixB > > & LinearSystem< STATES, INPUTS, OUTPUTS
>::discAB (
    const double & dt) [inline]
```

Returns a tuple of A and B after being discretized.

The documentation for this class was generated from the following file:

- linear\_system.h

## 5.41 Logger Class Reference

Class to simplify writing to files.

```
#include <logger.h>
```

### Public Member Functions

- **Logger** (const std::string &filename)  
*Create a logger that will save to a file.*
- **Logger** (const **Logger** &l)=delete  
*copying not allowed*
- **Logger** & **operator=** (const **Logger** &l)=delete

*Write a formatted string to the log with a loglevel.*

**Static Public Attributes**

- static constexpr int **MAX\_FORMAT\_LEN** = 512  
*maximum size for a string to be before it's written*

**5.41.1 Detailed Description**

Class to simplify writing to files.

**5.41.2 Constructor & Destructor Documentation****Logger()**

```
Logger::Logger (
    const std::string & filename) [explicit]
```

Create a logger that will save to a file.

**Parameters**

<i>filename</i>	the file to save to
-----------------	---------------------

**5.41.3 Member Function Documentation****Log() [1/2]**

```
void Logger::Log (
    const std::string & s)
```

Write a string to the log.

**Parameters**

<i>s</i>	the string to write
----------	---------------------

**Log() [2/2]**

```
void Logger::Log (
    LogLevel level,
    const std::string & s)
```

Write a string to the log with a loglevel.

**Parameters**

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>s</i>	the string to write

**Logf() [1/2]**

```
void Logger::Logf (
    const char * fmt,
    ...)
```

Write a formatted string to the log.

**Parameters**

<i>fmt</i>	the format string (like printf)
...	the args

**Logf() [2/2]**

```
void Logger::Logf (
    LogLevel level,
    const char * fmt,
    ...)
```

Write a formatted string to the log with a loglevel.

**Parameters**

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>fmt</i>	the format string (like printf)
...	the args

**Logln() [1/2]**

```
void Logger::Logln (
    const std::string & s)
```

Write a string and newline to the log.

**Parameters**

<i>s</i>	the string to write
----------	---------------------

**Logln() [2/2]**

```
void Logger::Logln (
    LogLevel level,
    const std::string & s)
```

Write a string and a newline to the log with a loglevel.

**Parameters**

<i>level</i>	the level to write. DEBUG, NOTICE, WARNING, ERROR, CRITICAL, TIME
<i>s</i>	the string to write

The documentation for this class was generated from the following files:

- logger.h
- logger.cpp

## 5.42 MotionController::m\_profile\_cfg\_t Struct Reference

```
#include <motion_controller.h>
```

### Public Attributes

- double **max\_v**  
*the maximum velocity the robot can drive*
- double **accel**  
*the most acceleration the robot can do*
- PID::pid\_config\_t **pid\_cfg**  
*configuration parameters for the internal PID controller*
- FeedForward::ff\_config\_t **ff\_cfg**  
*configuration parameters for the internal*

### 5.42.1 Detailed Description

m\_profile\_config holds all data the motion controller uses to plan paths. When motion profile is given a target to drive to, max\_v and accel are used to make the trapezoid profile instructing the controller how to drive pid\_cfg, ff\_cfg are used to find the motor outputs necessary to execute this path.

The documentation for this struct was generated from the following file:

- motion\_controller.h

## 5.43 StateMachine< System, IDType, Message, delay\_ms, do\_log >::MaybeMessage Class Reference

MaybeMessage a message of Message type or nothing. MaybeMessage m = {} // empty. MaybeMessage m = Message::EnumField1.

```
#include <state_machine.h>
```

### Public Member Functions

- **MaybeMessage ()**  
*Empty message - when theres no message.*
- **MaybeMessage (Message msg)**  
*Create a maybe message with a message.*
- bool **has\_message ()**  
*check if the message is here*
- Message **message ()**  
*Get the message stored. The return value is invalid unless has\_message returned true.*

### 5.43.1 Detailed Description

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log = false>
class StateMachine< System, IDType, Message, delay_ms, do_log >::MaybeMessage
```

`MaybeMessage` a message of `Message` type or nothing `MaybeMessage m = {};` // empty `MaybeMessage m = Message::EnumField1.`

### 5.43.2 Constructor & Destructor Documentation

#### `MaybeMessage()`

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =
false>
StateMachine< System, IDType, Message, delay_ms, do_log >::MaybeMessage::MaybeMessage (
    Message msg) [inline]
```

Create a `maybemessage` with a message.

##### Parameters

<code>msg</code>	the message to hold on to
------------------	---------------------------

### 5.43.3 Member Function Documentation

#### `has_message()`

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =
false>
bool StateMachine< System, IDType, Message, delay_ms, do_log >::MaybeMessage::has_message () [inline]
```

check if the message is here

##### Returns

true if there is a message

#### `message()`

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =
false>
Message StateMachine< System, IDType, Message, delay_ms, do_log >::MaybeMessage::message () [inline]
```

Get the message stored. The return value is invalid unless `has_message` returned true.

##### Returns

The message if it exists. Undefined otherwise

The documentation for this class was generated from the following file:

- state\_machine.h

## 5.44 MecanumDrive Class Reference

```
#include <mecanum_drive.h>
```

### Classes

- struct [mecanumdrive\\_config\\_t](#)

### Public Member Functions

- [MecanumDrive](#) (vex::motor &left\_front, vex::motor &right\_front, vex::motor &left\_rear, vex::motor &right\_rear, vex::rotation \*lateral\_wheel=NULL, vex::inertial \*imu=NULL, [mecanumdrive\\_config\\_t](#) \*config=NULL)
- void [drive\\_raw](#) (double direction\_deg, double magnitude, double rotation)
- void [drive](#) (double left\_y, double left\_x, double right\_x, int power=2)
- bool [auto\\_drive](#) (double inches, double direction, double speed, bool gyro\_correction=true)
- bool [auto\\_turn](#) (double degrees, double speed, bool ignore\_imu=false)

#### 5.44.1 Detailed Description

A class representing the Mecanum drivetrain. Contains 4 motors, a possible IMU (intertial), and a possible undriven perpendicular wheel.

#### 5.44.2 Constructor & Destructor Documentation

##### [MecanumDrive\(\)](#)

```
MecanumDrive::MecanumDrive (
    vex::motor & left_front,
    vex::motor & right_front,
    vex::motor & left_rear,
    vex::motor & right_rear,
    vex::rotation * lateral_wheel = NULL,
    vex::inertial * imu = NULL,
    mecanumdrive\_config\_t * config = NULL)
```

Create the Mecanum drivetrain object

#### 5.44.3 Member Function Documentation

##### [auto\\_drive\(\)](#)

```
bool MecanumDrive::auto_drive (
    double inches,
    double direction,
    double speed,
    bool gyro_correction = true)
```

Drive the robot in a straight line automatically. If the inertial was declared in the constructor, use it to correct while driving. If the lateral wheel was declared in the constructor, use it for more accurate positioning while strafing.

**Parameters**

<i>inches</i>	How far the robot should drive, in inches
<i>direction</i>	What direction the robot should travel in, in degrees. 0 is forward, +/-180 is reverse, clockwise is positive.
<i>speed</i>	The maximum speed the robot should travel, in percent: -1.0->+1.0
<i>gyro_correction</i>	=true Whether or not to use the gyro to help correct while driving. Will always be false if no gyro was declared in the constructor.

Drive the robot in a straight line automatically. If the inertial was declared in the constructor, use it to correct while driving. If the lateral wheel was declared in the constructor, use it for more accurate positioning while strafing.

**Parameters**

<i>inches</i>	How far the robot should drive, in inches
<i>direction</i>	What direction the robot should travel in, in degrees. 0 is forward, +/-180 is reverse, clockwise is positive.
<i>speed</i>	The maximum speed the robot should travel, in percent: -1.0->+1.0
<i>gyro_correction</i>	= true Whether or not to use the gyro to help correct while driving. Will always be false if no gyro was declared in the constructor.

**Returns**

Whether or not the maneuver is complete.

**auto\_turn()**

```
bool MecanumDrive::auto_turn (
    double degrees,
    double speed,
    bool ignore_imu = false)
```

Autonomously turn the robot X degrees over it's center point. Uses a closed loop for control.

**Parameters**

<i>degrees</i>	How many degrees to rotate the robot. Clockwise postive.
<i>speed</i>	What percentage to run the motors at: 0.0 -> 1.0
<i>ignore_imu</i>	=false Whether or not to use the Inertial for determining angle. Will instead use circumference formula + robot's wheelbase + encoders to determine.

**Returns**

whether or not the robot has finished the maneuver

Autonomously turn the robot X degrees over it's center point. Uses a closed loop for control.

**Parameters**

<i>degrees</i>	How many degrees to rotate the robot. Clockwise postive.
<i>speed</i>	What percentage to run the motors at: 0.0 -> 1.0
<i>ignore_imu</i>	= false Whether or not to use the Inertial for determining angle. Will instead use circumference formula + robot's wheelbase + encoders to determine.

**Returns**

whether or not the robot has finished the maneuver

**drive()**

```
void MecanumDrive::drive (
    double left_y,
    double left_x,
    double right_x,
    int power = 2)
```

Drive the robot with a mecanum-style / arcade drive. Inputs are in percent (-100.0 -> 100.0) straight from the controller. Controls are mixed, so the robot can drive forward / strafe / rotate all at the same time.

**Parameters**

<i>left_y</i>	left joystick, Y axis (forward / backwards)
<i>left_x</i>	left joystick, X axis (strafe left / right)
<i>right_x</i>	right joystick, X axis (rotation left / right)
<i>power</i>	=2 how much of a "curve" there should be on drive controls; better for low speed maneuvers. Leave blank for a default curve of 2 (higher means more fidelity)

Drive the robot with a mecanum-style / arcade drive. Inputs are in percent (-100.0 -> 100.0) straight from the controller. Controls are mixed, so the robot can drive forward / strafe / rotate all at the same time.

**Parameters**

<i>left_y</i>	left joystick, Y axis (forward / backwards)
<i>left_x</i>	left joystick, X axis (strafe left / right)
<i>right_x</i>	right joystick, X axis (rotation left / right)
<i>power</i>	=2 how much of a "curve" there should be on drive controls; better for low speed maneuvers. Leave blank for a default curve of 2 (higher means more fidelity)

**drive\_raw()**

```
void MecanumDrive::drive_raw (
    double direction_deg,
    double magnitude,
    double rotation)
```

Drive the robot using vectors. This handles all the math required for mecanum control.

**Parameters**

<i>direction_deg</i>	the direction to drive the robot, in degrees. 0 is forward, 180 is back, clockwise is positive, counterclockwise is negative.
<i>magnitude</i>	How fast the robot should drive, in percent: 0.0->1.0
<i>rotation</i>	How fast the robot should rotate, in percent: -1.0->+1.0

The documentation for this class was generated from the following files:

- mecanum\_drive.h
- mecanum\_drive.cpp

## 5.45 MecanumDrive::mecanumdrive\_config\_t Struct Reference

```
#include <mecanum_drive.h>
```

### 5.45.1 Detailed Description

Configure the Mecanum drive [PID](#) tunings and robot configurations

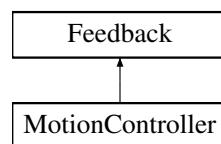

The documentation for this struct was generated from the following file:

- `mecanum_drive.h`

## 5.46 MotionController Class Reference

```
#include <motion_controller.h>
```

Inheritance diagram for MotionController:

### Classes

- struct [m\\_profile\\_cfg\\_t](#)

### 5.46.1 Detailed Description

Motion Controller class

This class defines a top-level motion profile, which can act as an intermediate between a subsystem class and the motors themselves

This takes the constants kS, kV, kA, kP, kI, kD, max\_v and acceleration and wraps around a feedforward, [PID](#) and trapezoid profile. It does so with the following formula:

```
out = feedforward.calculate(motion_profile.get(time_s)) + pid.get(motion_profile.get(time_s))
```

For [PID](#) and Feedforward specific formulae, see [pid.h](#), [feedforward.h](#), and [trapezoid\\_profile.h](#)

#### Author

Ryan McGee

#### Date

7/13/2022

### 5.46.2 Constructor & Destructor Documentation

#### **MotionController()**

```
MotionController::MotionController (
    m_profile_cfg_t & config)
```

Construct a new Motion Controller object.

##### Parameters

<i>config</i>	The definition of how the robot is able to move max_v Maximum velocity the movement is capable of accel Acceleration / deceleration of the movement pid_cfg Definitions of kP, kI, and kD ff_cfg Definitions of kS, kV, and kA
---------------	--

### 5.46.3 Member Function Documentation

#### **get()**

```
double MotionController::get () [override], [virtual]
```

##### Returns

the last saved result from the feedback controller

Implements [Feedback](#).

**get\_motion()**

```
motion_t MotionController::get_motion () const
```

**Returns**

The current position, velocity and acceleration setpoints

**init()**

```
void MotionController::init (
    double start_pt,
    double end_pt) [override], [virtual]
```

Initialize the motion profile for a new movement This will also reset the [PID](#) and profile timers.

**Parameters**

<i>start_pt</i>	Movement starting position
<i>end_pt</i>	Movement ending position

Implements [Feedback](#).

**is\_on\_target()**

```
bool MotionController::is_on_target () [override], [virtual]
```

**Returns**

Whether or not the movement has finished, and the [PID](#) confirms it is on target

Implements [Feedback](#).

**set\_limits()**

```
void MotionController::set_limits (
    double lower,
    double upper) [override], [virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied. if limits are applied, the controller will not target any value below lower or above upper

**Parameters**

<i>lower</i>	upper limit
<i>upper</i>	lower limit

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

**Parameters**

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implements [Feedback](#).

**tune\_feedforward()**

```
FeedForward::ff_config_t MotionController::tune_feedforward (
    TankDrive & drive,
    OdometryTank & odometry,
    double pct = 0.6,
    double duration = 2) [static]
```

This method attempts to characterize the robot's drivetrain and automatically tune the feedforward. It does this by first calculating the kS (voltage to overcome static friction) by slowly increasing the voltage until it moves.

Next is kV (voltage to sustain a certain velocity), where the robot will record it's steady-state velocity at 'pct' speed.

Finally, kA (voltage needed to accelerate by a certain rate), where the robot will record the entire movement's velocity and acceleration, record a plot of [X=(pct-kV\*V-kS), Y=(Acceleration)] along the movement, and since kA\*Accel = pct-kV\*V-kS, the reciprocal of the linear regression is the kA value.

**Parameters**

<i>drive</i>	The tankdrive to operate on
<i>odometry</i>	The robot's odometry subsystem
<i>pct</i>	Maximum velocity in percent (0->1.0)
<i>duration</i>	Amount of time the robot should be moving for the test

**Returns**

A tuned feedforward object

**update()**

```
double MotionController::update (
    double sensor_val) [override], [virtual]
```

Update the motion profile with a new sensor value.

**Parameters**

<i>sensor_val</i>	Value from the sensor
-------------------	-----------------------

**Returns**

the motor input generated from the motion profile

Implements [Feedback](#).

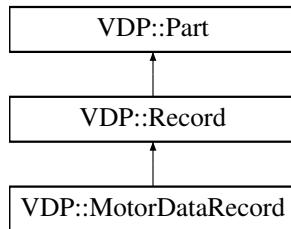

The documentation for this class was generated from the following files:

- motion\_controller.h
- motion\_controller.cpp

## 5.47 VDP::MotorDataRecord Class Reference

### 5.47.1 Detailed Description

Defines a record that holds motor values

### 5.47.2 Constructor & Destructor Documentation

#### [MotorDataRecord\(\)](#)

```
VDP::MotorDataRecord::MotorDataRecord (
    std::string name,
    vex::motor & motor)
```

Creates a record that contains a Float of the motor position Float of the motor velocity Float of the motor tempurature  
Float of the motor voltage Float of the motor current

**Parameters**

<i>name</i>	the name of the record to create
<i>mot</i>	the motor to get data from

**5.47.3 Member Function Documentation****fetch()**

```
void VDP::MotorDataRecord::fetch () [override], [virtual]
```

sets the data that the Motor Parts hold

Implements [VDP::Part](#).

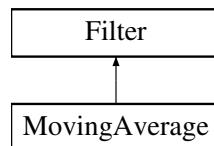

The documentation for this class was generated from the following files:

- [builtins.hpp](#)
- [builtins.cpp](#)

**5.48 MovingAverage Class Reference**

```
#include <moving_average.h>
```

Inheritance diagram for MovingAverage:

**Public Member Functions**

- [MovingAverage \(int buffer\\_size\)](#)
- [MovingAverage \(int buffer\\_size, double starting\\_value\)](#)
- void [add\\_entry \(double n\)](#) override
- double [get\\_value \(\)](#) const override
- int [get\\_size \(\)](#) const

**5.48.1 Detailed Description****MovingAverage**

A moving average is a way of smoothing out noisy data. For many sensor readings, the noise is roughly symmetric around the actual value. This means that if you collect enough samples those that are too high are cancelled out by the samples that are too low leaving the real value.

The [MovingAverage](#) class provides a simple interface to do this smoothing from our noisy sensor values.

WARNING: because we need a lot of samples to get the actual value, the value given by the [MovingAverage](#) will 'lag' behind the actual value that the sensor is reading. Using a [MovingAverage](#) is thus a tradeoff between accuracy and lag time (more samples) vs. less accuracy and faster updating (less samples).

### 5.48.2 Constructor & Destructor Documentation

#### MovingAverage() [1/2]

```
MovingAverage::MovingAverage (
    int buffer_size)
```

Create a moving average calculator with 0 as the default value

##### Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
--------------------	---

#### MovingAverage() [2/2]

```
MovingAverage::MovingAverage (
    int buffer_size,
    double starting_value)
```

Create a moving average calculator with a specified default value

##### Parameters

<i>buffer_size</i>	The size of the buffer. The number of samples that constitute a valid reading
<i>starting_value</i>	The value that the average will be before any data is added

### 5.48.3 Member Function Documentation

#### add\_entry()

```
void MovingAverage::add_entry (
    double n) [override], [virtual]
```

Add a reading to the buffer Before: [ 1 1 2 2 3 3 ] => 2 ^ After: [ 2 1 2 2 3 3 ] => 2.16 ^

##### Parameters

<i>n</i>	the sample that will be added to the moving average.
----------	--

Implements [Filter](#).

#### get\_size()

```
int MovingAverage::get_size () const
```

How many samples the average is made from

##### Returns

the number of samples used to calculate this average

**get\_value()**

```
double MovingAverage::get_value () const [override], [virtual]
```

Returns the average based off of all the samples collected so far

**Returns**

the calculated average. sum(samples)/numsamples

How many samples the average is made from

**Returns**

the number of samples used to calculate this average

Implements [Filter](#).

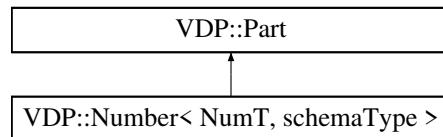

The documentation for this class was generated from the following files:

- moving\_average.h
- moving\_average.cpp

**5.49 VDP::Number< NumT, schemaType > Class Template Reference**

- `void write_message (PacketWriter &sofar) const override`

### 5.49.1 Detailed Description

```
template<typename NumT, Type schemaType>
class VDP::Number< NumT, schemaType >
```

A number conveyed as a part

### 5.49.2 Member Typedef Documentation

#### FetchFunc

```
template<typename NumT, Type schemaType>
using VDP::Number< NumT, schemaType >::FetchFunc = std::function<NumberType()>
```

Function to run when fetching this number

### 5.49.3 Constructor & Destructor Documentation

#### Number()

```
template<typename NumT, Type schemaType>
VDP::Number< NumT, schemaType >::Number (
    std::string field_name,
    FetchFunc fetcher = []() { return (NumberType)0; }) [inline], [explicit]
```

creates a number with a name and fetcher

#### Parameters

<code>field</code>	name for the number part
<code>fetcher</code>	the function to run when fetching this number

#### 5.49.4 Member Function Documentation

##### **fetch()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::fetch () [inline], [override], [virtual]
```

sets the value of the number stored to the value returned by its fetcher

Implements [VDP::Part](#).

##### **get\_value()**

```
template<typename NumT, Type schemaType>
NumberType VDP::Number< NumT, schemaType >::get_value () [inline]
```

##### Returns

the currently stored number value

##### **pprint()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::pprint (
    std::stringstream & ss,
    size_t indent) const [inline], [override], [virtual]
```

prints the [Number](#) with the format "[indent]name: schema\_string"

##### Parameters

<i>ss</i>	the stream of strings to print to
<i>indent</i>	the amount of indents to use

Implements [VDP::Part](#).

##### **pprint\_data()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::pprint_data (
    std::stringstream & ss,
    size_t indent) const [inline], [override], [virtual]
```

prints the data the number holds with the format "[indent]name: value"

##### Parameters

<i>ss</i>	the stream of strings to print to
<i>indent</i>	the amount of indents to use

Implements [VDP::Part](#).

##### **read\_data\_from\_message()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::read_data_from_message (
    PacketReader & reader) [inline], [override], [virtual]
```

sets the value of the number stored to the value read by a [PacketReader](#)

**Parameters**

<i>reader</i>	the packet reader to get the number from
---------------	--

Implements [VDP::Part](#).

**set\_value()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::set_value (
    NumberType val) [inline]
```

sets the value of the number stored

**Parameters**

<i>val</i>	the value to store
------------	--------------------

**write\_message()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::write_message (
    PacketWriter & sofar) const [inline], [override], [protected], [virtual]
```

writes the number's data to a packet

**Parameters**

<i>sofar</i>	the packet writer to write with
--------------	---------------------------------

Implements [VDP::Part](#).

**write\_schema()**

```
template<typename NumT, Type schemaType>
void VDP::Number< NumT, schemaType >::write_schema (
    PacketWriter & sofar) const [inline], [override], [protected], [virtual]
```

writes the number's schematic to a packet

**Parameters**

<i>sofar</i>	the packet writer to write with
--------------	---------------------------------

Implements [VDP::Part](#).

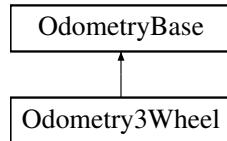

The documentation for this class was generated from the following file:

- types.hpp

### 5.50.1 Detailed Description

#### Odometry3Wheel

This class handles the code for a standard 3-pod odometry setup, where there are 3 "pods" made up of undriven (dead) wheels connected to encoders in the following configuration:

+Y ----- ^ | | | | | | | O | | | | | | | === | | ----- | +-----> + X

Where O is the center of rotation. The robot will monitor the changes in rotation of these wheels and calculate the robot's X, Y and rotation on the field.

This is a "set and forget" class, meaning once the object is created, the robot will immediately begin tracking its movement in the background.

#### Author

Ryan McGee

#### Date

Oct 31 2022

### 5.50.2 Constructor & Destructor Documentation

#### Odometry3Wheel()

```
Odometry3Wheel::Odometry3Wheel (
    CustomEncoder & lside_fwd,
    CustomEncoder & rside_fwd,
    CustomEncoder & off_axis,
    odometry3wheel_cfg_t & cfg,
    bool is_async = true)
```

Construct a new Odometry 3 Wheel object

#### Parameters

<i>lside_fwd</i>	left-side encoder reference
<i>rside_fwd</i>	right-side encoder reference
<i>off_axis</i>	off-axis (perpendicular) encoder reference
<i>cfg</i>	robot odometry configuration
<i>is_async</i>	true to constantly run in the background

### 5.50.3 Member Function Documentation

#### tune()

```
void Odometry3Wheel::tune (
    vex::controller & con,
    TankDrive & drive)
```

A guided tuning process to automatically find tuning parameters. This method is blocking, and returns when tuning has finished. Follow the instructions on the controller to complete the tuning process

**Parameters**

<i>con</i>	Controller reference, for screen and button control
<i>drive</i>	Drivetrain reference for robot control

A guided tuning process to automatically find tuning parameters. This method is blocking, and returns when tuning has finished. Follow the instructions on the controller to complete the tuning process

It is assumed the gear ratio and encoder PPR have been set correctly

**update()**

```
Pose2d Odometry3Wheel::update () [override], [virtual]
```

Update the current position of the robot once, using the current state of the encoders and the previous known location

**Returns**

the robot's updated position

Implements [OdometryBase](#).

The documentation for this class was generated from the following files:

- [odometry\\_3wheel.h](#)
- [odometry\\_3wheel.cpp](#)

**5.51 Odometry3Wheel::odometry3wheel\_cfg\_t Struct Reference**

```
#include <odometry_3wheel.h>
```

**Public Attributes**

- [double wheelbase\\_dist](#)
- [double off\\_axis\\_center\\_dist](#)
- [double wheel\\_diam](#)

**5.51.1 Detailed Description**

[odometry3wheel\\_cfg\\_t](#) holds all the specifications for how to calculate position with 3 encoders See the core wiki for what exactly each of these parameters measures

**5.51.2 Member Data Documentation****off\_axis\_center\_dist**

```
double Odometry3Wheel::odometry3wheel_cfg_t::off_axis_center_dist
```

distance from the center of the robot to the center off axis wheel

**wheel\_diam**

```
double Odometry3Wheel::odometry3wheel_cfg_t::wheel_diam
```

the diameter of the tracking wheel

**wheelbase\_dist**

```
double Odometry3Wheel::odometry3wheel_cfg_t::wheelbase_dist
```

distance from the center of the left wheel to the center of the right wheel

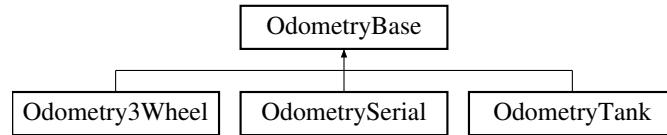

The documentation for this struct was generated from the following file:

- odometry\_3wheel.h

## 5.52 OdometryBase Class Reference

```
#include <odometry_base.h>
```

Inheritance diagram for OdometryBase:

### Public Member Functions

- double **speed**
- double **accel**
- double **ang\_speed\_deg**
- double **ang\_accel\_deg**

### 5.52.1 Detailed Description

#### OdometryBase

This base class contains all the shared code between different implementations of odometry. It handles the asynchronous management, position input/output and basic math functions, and holds positional types specific to field orientation.

All future odometry implementations should extend this file and redefine [update\(\)](#) function.

#### Author

Ryan McGee

#### Date

Aug 11 2021

### 5.52.2 Constructor & Destructor Documentation

#### OdometryBase()

```
OdometryBase::OdometryBase (
    bool is_async)
```

Construct a new Odometry Base object

#### Parameters

<code>is_async</code>	True to run constantly in the background, false to call <a href="#">update()</a> manually
-----------------------	---

### 5.52.3 Member Function Documentation

#### background\_task()

```
int OdometryBase::background_task (
    void * ptr) [static]
```

Function that runs in the background task. This function pointer is passed to the vex::task constructor.

**Parameters**

<i>ptr</i>	Pointer to <a href="#">OdometryBase</a> object
------------	--

**Returns**

Required integer return code. Unused.

**end\_async()**

```
void OdometryBase::end_async ()
```

End the background task. Cannot be restarted. If the user wants to end the thread but keep the data up to date, they must run the [update\(\)](#) function manually from then on.

**get\_accel()**

```
double OdometryBase::get_accel () [virtual]
```

Get the current acceleration

**Returns**

the acceleration rate of the robot (inch/s<sup>2</sup>)

**get\_angular\_accel\_deg()**

```
double OdometryBase::get_angular_accel_deg ()
```

Get the current angular acceleration in degrees

**Returns**

the angular acceleration at which we are turning (deg/s<sup>2</sup>)

**get\_angular\_speed\_deg()**

```
double OdometryBase::get_angular_speed_deg ()
```

Get the current angular speed in degrees

**Returns**

the angular velocity at which we are turning (deg/s)

**get\_position()**

```
Pose2d OdometryBase::get_position (
    void ) [virtual]
```

Gets the current position and rotation

**Returns**

the position that the odometry believes the robot is at

Gets the current position and rotation

Reimplemented in [OdometrySerial](#).

**get\_speed()**

```
double OdometryBase::get_speed () [virtual]
```

Get the current speed

**Returns**

the speed at which the robot is moving and grooving (inch/s)

**set\_position()**

```
void OdometryBase::set_position (
    const Pose2d & newpos = zero_pos) [virtual]
```

Sets the current position of the robot

**Parameters**

<i>newpos</i>	the new position that the odometry will believe it is at
---------------	--

Sets the current position of the robot

Reimplemented in [OdometrySerial](#), and [OdometryTank](#).

**smallest\_angle()**

```
double OdometryBase::smallest_angle (
    double start_deg,
    double end_deg) [static]
```

Get the smallest difference in angle between a start heading and end heading. Returns the difference between -180 degrees and +180 degrees, representing the robot turning left or right, respectively.

**Parameters**

<code>start_deg</code>	initial angle (degrees)
<code>end_deg</code>	final angle (degrees)

**Returns**

the smallest angle from the initial to the final angle. This takes into account the wrapping of rotations around 360 degrees

Get the smallest difference in angle between a start heading and end heading. Returns the difference between -180 degrees and +180 degrees, representing the robot turning left or right, respectively.

**update()**

```
virtual Pose2d OdometryBase::update () [pure virtual]
```

Update the current position on the field based on the sensors

**Returns**

the location that the robot is at after the odometry does its calculations

Implemented in [Odometry3Wheel](#), [OdometrySerial](#), and [OdometryTank](#).

#### 5.52.4 Member Data Documentation

**accel**

```
double OdometryBase::accel
```

the rate at which we are accelerating (inch/s<sup>2</sup>)

**ang\_accel\_deg**

```
double OdometryBase::ang_accel_deg
```

the rate at which we are accelerating our turn (deg/s<sup>2</sup>)

**ang\_speed\_deg**

```
double OdometryBase::ang_speed_deg
```

the speed at which we are turning (deg/s)

**current\_pos**

```
Pose2d OdometryBase::current_pos
```

Current position of the robot in terms of x,y,rotation

**handle**

```
vex::task* OdometryBase::handle
```

handle to the vex task that is running the odometry code

**mut**

```
vex::mutex OdometryBase::mut
```

Mutex to control multithreading

**speed**

```
double OdometryBase::speed
```

the speed at which we are travelling (inch/s)

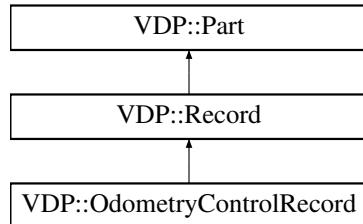

The documentation for this class was generated from the following files:

- odometry\_base.h
- odometry\_base.cpp

## 5.53 VDP::OdometryControlRecord Class Reference

- [builtins.cpp](#)

## 5.55 screen::OdometryPage Class Reference

a page that shows odometry position and rotation and a map (if an sd card with the file is on)

```
#include <screen.h>
```

Inheritance diagram for screen::OdometryPage:

### Public Member Functions

- [OdometryPage \(OdometryBase &odom, double robot\\_width, double robot\\_height, bool do\\_trail\)](#)  
*Create an odometry trail. Make sure odometry is initialized before now.*
- void [update \(bool was\\_pressed, int x, int y\) override](#)
- void [draw \(vex::brain::lcd &, bool first\\_draw, unsigned int frame\\_number\) override](#)

#### 5.55.1 Detailed Description

a page that shows odometry position and rotation and a map (if an sd card with the file is on)

#### 5.55.2 Constructor & Destructor Documentation

##### OdometryPage()

```
screen::OdometryPage::OdometryPage (
    OdometryBase & odom,
    double robot_width,
    double robot_height,
    bool do_trail)
```

Create an odometry trail. Make sure odometry is initialized before now.

##### Parameters

<i>odom</i>	the odometry system to monitor
<i>robot_width</i>	the width (side to side) of the robot in inches. Used for visualization
<i>robot_height</i>	the robot_height (front to back) of the robot in inches. Used for visualization
<i>do_trail</i>	whether or not to calculate and draw the trail. Drawing and storing takes a very <i>slight</i> extra amount of processing power

### 5.55.3 Member Function Documentation

#### **draw()**

```
void screen::OdometryPage::draw (
    vex::brain::lcd & scr,
    bool first_draw,
    unsigned int frame_number) [override], [virtual]
```

**5.56.1 Detailed Description****OdometrySerial**

This class handles the code for an odometry setup where calculations are done on an external coprocessor. Data is sent to the brain via smart port, using a generic serial (UART) connection.

This is a "set and forget" class, meaning once the object is created, the robot will immediately begin tracking its movement in the background.

#### Author

Jack Cammarata

#### Date

Jan 16 2025 Construct a new Odometry Serial Object

### 5.56.3 Member Function Documentation

#### cobs\_decode()

```
size_t OdometrySerial::cobs_decode (
    const uint8_t * buffer,
    size_t length,
    void * data)
```

COBS decode data from buffer

#### Parameters

<i>buffer</i>	Pointer to encoded input bytes
<i>length</i>	Number of bytes to decode
<i>data</i>	Pointer to decoded output data

#### Returns

Number of bytes successfully decoded

#### Note

Stops decoding if delimiter byte is found

**cobs\_encode()**

```
size_t OdometrySerial::cobs_encode (
    const void * data,
    size_t length,
    uint8_t * buffer)
```

COBS encode data to buffer

**Parameters**

<i>data</i>	Pointer to input data to encode
<i>length</i>	Number of bytes to encode
<i>buffer</i>	Pointer to encoded output buffer

**Returns**

Encoded buffer length in bytes

**Note**

Does not output delimiter byte

**get\_pose2d()**

```
Pose2d OdometrySerial::get_pose2d (
    void )
```

Gets the current position and rotation

**Returns**

the position that the odometry believes the robot is at

**get\_position()**

```
Pose2d OdometrySerial::get_position (
    void ) [override], [virtual]
```

Gets the current position and rotation

**Returns**

the position that the odometry believes the robot is at

Reimplemented from [OdometryBase](#).

**receive\_cobs\_packet()**

```
int OdometrySerial::receive_cobs_packet (
    uint32_t port,
    uint8_t * buffer,
    size_t buffer_size)
```

Attempts to receive an entire packet encoded with COBS, stops at delimiter or there's a buffer overflow

**Parameters**

<i>port</i>	the port number the serial is plugged into, counts from 0 instead of 1
<i>buffer</i>	pointer to a <code>uint8_t[]</code> where we put the data
<i>buffer_size</i>	length in bytes of the buffer

**Returns**

0 success

**send\_config()**

```
void OdometrySerial::send_config (
    const Pose2d & initial_pose,
    const Pose2d & sensor_offset,
    const bool & calc_vel_acc_on_brain)
```

Send

**set\_position()**

```
void OdometrySerial::set_position (
    const Pose2d & new_pose) [override], [virtual]
```

Resets the position and rotational data to the input.

Resets the position and rotational data to the input.

**Parameters**

<i>new_pose</i>	the pose to set the odometry to
-----------------	---------------------------------

Reimplemented from [OdometryBase](#).

**update()**

```
Pose2d OdometrySerial::update () [override], [virtual]
```

Update the current position of the robot once by reading a single packet from the serial port

**Returns**

the robot's updated position

Update the current position of the robot once by reading a single packet from the serial port, then updating all over values, velocity, accel

**Returns**

the robot's updated position

Implements [OdometryBase](#).

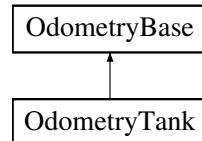

The documentation for this class was generated from the following files:

- `odometry_serial.h`
- `odometry_serial.cpp`

## 5.57 OdometryTank Class Reference

```
#include <odometry_tank.h>
```

Inheritance diagram for OdometryTank:

### Public Member Functions

- double [ang\\_accel\\_deg](#)

### 5.57.1 Detailed Description

[OdometryTank](#) defines an odometry system for a tank drivetrain. This requires encoders in the same orientation as the drive wheels. Odometry is a "start and forget" subsystem, which means once it's created and configured, it will constantly run in the background and track the robot's X, Y and rotation coordinates.

### 5.57.2 Constructor & Destructor Documentation

#### [OdometryTank\(\)](#) [1/3]

```
OdometryTank::OdometryTank (
    vex::motor_group & left_side,
    vex::motor_group & right_side,
    robot\_specs\_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true)
```

Initialize the Odometry module, calculating position from the drive motors.

##### Parameters

<i>left_side</i>	The left motors
<i>right_side</i>	The right motors
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See <a href="#">robot_specs_t</a> for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call <a href="#">update()</a> .

#### [OdometryTank\(\)](#) [2/3]

```
OdometryTank::OdometryTank (
    CustomEncoder & left_custom_enc,
    CustomEncoder & right_custom_enc,
    robot\_specs\_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true)
```

Initialize the Odometry module, calculating position from the drive motors.

##### Parameters

<i>left_custom_enc</i>	The left custom encoder
<i>right_custom_enc</i>	The right custom encoder
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See <a href="#">robot_specs_t</a> for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call <a href="#">update()</a> .

**OdometryTank() [3/3]**

```
OdometryTank::OdometryTank (
    vex::encoder & left_vex_enc,
    vex::encoder & right_vex_enc,
    robot\_specs\_t & config,
    vex::inertial * imu = NULL,
    bool is_async = true)
```

Initialize the Odometry module, calculating position from the drive motors.

**Parameters**

<i>left_vex_enc</i>	The left vex encoder
<i>right_vex_enc</i>	The right vex encoder
<i>config</i>	the specifications that supply the odometry with descriptions of the robot. See <a href="#">robot_specs_t</a> for what is contained
<i>imu</i>	The robot's inertial sensor. If not included, rotation is calculated from the encoders.
<i>is_async</i>	If true, position will be updated in the background continuously. If false, the programmer will have to manually call <a href="#">update()</a> .

**5.57.3 Member Function Documentation****set\_position()**

```
void OdometryTank::set_position (
    const Pose2d & newpos = zero_pos) [override], [virtual]
```

`set_position` tells the odometry to place itself at a position

**Parameters**

<i>newpos</i>	the position the odometry will take
---------------	-------------------------------------

Resets the position and rotational data to the input.

Reimplemented from [OdometryBase](#).

**update()**

```
Pose2d OdometryTank::update () [override], [virtual]
```

Update the current position on the field based on the sensors

**Returns**

the position that odometry has calculated itself to be at

Update, store and return the current position of the robot. Only use if not initializing with a separate thread.

Implements [OdometryBase](#).

The documentation for this class was generated from the following files:

- `odometry_tank.h`
- `odometry_tank.cpp`

## 5.58 OdomSetPosition Class Reference

```
#include <drive_commands.h>
```

### Public Member Functions

- `OdomSetPosition (OdometryBase &odom, const Pose2d &newpos=OdometryBase::zero_pos)`
- `bool run () override`

#### 5.58.1 Detailed Description

AutoCommand wrapper class for the set\_position function in the Odometry class

#### 5.58.2 Constructor & Destructor Documentation

##### `OdomSetPosition()`

```
OdomSetPosition::OdomSetPosition (
    OdometryBase & odom,
    const Pose2d & newpos = OdometryBase::zero_pos)
```

constructs a new `OdomSetPosition` command

##### Parameters

<code>odom</code>	the odometry system we are setting
<code>newpos</code>	the position we are telling the odometry to take. defaults to (0, 0), angle = 90

Construct an Odometry set pos

##### Parameters

<code>odom</code>	the odometry system we are setting
<code>newpos</code>	the now position to set the odometry to

#### 5.58.3 Member Function Documentation

##### `run()`

```
bool OdomSetPosition::run () [override]
```

Run set\_position Overrides run from AutoCommand

##### Returns

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- `drive_commands.h`
- `drive_commands.cpp`

## 5.59 VDP::PacketHeader Struct Reference

```
#include <protocol.hpp>
```

### 5.59.1 Detailed Description

struct to define the header of a packet, defines whether a packet is Broadcast or data and whether a packet is send or receive

The documentation for this struct was generated from the following file:

- protocol.hpp

## 5.60 VDP::PacketWriter Class Reference

```
#include <protocol.hpp>
```

### Public Member Functions

- [PacketWriter](#) (Packet &scratch\_space)
- void [clear](#) ()
- size\_t [size](#) ()
- void [write\\_byte](#) (uint8\_t b)
- void [write\\_type](#) (Type t)
- void [write\\_string](#) (const std::string &str)
- void [write\\_channel\\_acknowledge](#) (const Channel &chan)
- void [write\\_channel\\_broadcast](#) (const Channel &chan)
- void [write\\_response](#) (std::deque< Channel > &channels)
- void [write\\_data\\_message](#) (const Channel &part)
- void [write\\_request](#) ()
- const Packet & [get\\_packet](#) () const
- template<typename Number>  
void [write\\_number](#) (const Number &num)

### 5.60.1 Detailed Description

Defines a [PacketWriter](#), it writes packets

### 5.60.2 Constructor & Destructor Documentation

#### [PacketWriter\(\)](#)

```
VDP::PacketWriter::PacketWriter (
    VDP::Packet & scratch) [explicit]
```

creates a packet writer

**Parameters**

<code>scratch_space</code>	the packet for the writer to write to
----------------------------	---------------------------------------

**5.60.3 Member Function Documentation****clear()**

```
void VDP::PacketWriter::clear ()
```

clears the packet the writer is writing to

**get\_packet()**

```
const Packet & VDP::PacketWriter::get_packet () const
```

**Returns**

the packet the writer is writing to

**size()**

```
size_t VDP::PacketWriter::size ()
```

**Returns**

the size of the packet

**write\_byte()**

```
void VDP::PacketWriter::write_byte (
    uint8_t b)
```

writes a byte to the end of the packet

**Parameters**

<code>b</code>	the byte to write
----------------	-------------------

**write\_channel\_acknowledge()**

```
void VDP::PacketWriter::write_channel_acknowledge (
    const Channel & chan)
```

writes a broadcast acknowledgement of a channel to the packet

**Parameters**

<i>chan</i>	the channel to write the acknowledgement for
-------------	--

**write\_channel\_broadcast()**

```
void VDP::PacketWriter::write_channel_broadcast (
    const Channel & chan)
```

writes a broadcast of a channel schematic to the packet

**Parameters**

<i>chan</i>	the channel to write the schematic from
-------------	---

**write\_data\_message()**

```
void VDP::PacketWriter::write_data_message (
    const Channel & chan)
```

writes the data from a channel to the packet

**Parameters**

<i>chan</i>	the Channel to write the data from
-------------	------------------------------------

**write\_number()**

```
template<typename Number>
void VDP::PacketWriter::write_number (
    const Number & num) [inline]
```

writes a number to the end of the packet

**write\_request()**

```
void VDP::PacketWriter::write_request ()
```

writes a request for a channel schematic to the packets

**Parameters**

<i>chan</i>	the Channel to write the data from
-------------	------------------------------------

writes a request for a channel schematic to the packet

**Parameters**

<i>chan</i>	the channel to request
-------------	------------------------

**write\_response()**

```
void VDP::PacketWriter::write_response (
    std::deque< Channel > & response_queue)
```

writes a response packet to the packets

**Parameters**

<i>chan</i>	the Channel to write the data from
-------------	------------------------------------

writes a response packet to the brain

**Parameters**

<i>response_queue</i>	the queue of channels to respond with
-----------------------	---------------------------------------

**write\_string()**

```
void VDP::PacketWriter::write_string (
    const std::string & str)
```

writes a string to the packet

**Parameters**

<i>str</i>	the string to write to the packet
------------	-----------------------------------

**write\_type()**

```
void VDP::PacketWriter::write_type (
    Type t)
```

writes a VDP type to the packet in the form of a byte

**Parameters**

<i>t</i>	the VDP type to write to the packet
----------	-------------------------------------

The documentation for this class was generated from the following files:

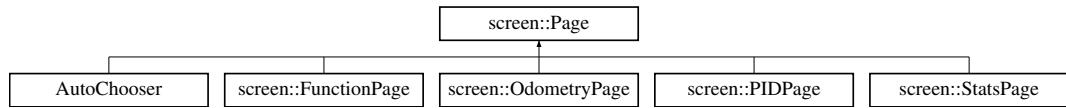

- protocol.hpp
- protocol.cpp

## 5.61 screen::Page Class Reference

[Page](#) describes one part of the screen slideshow.

```
#include <screen.h>
```

Inheritance diagram for screen::Page:

### Public Member Functions

- virtual void [update](#) (bool was\_pressed, int x, int y)  
*collect data, respond to screen input, do fast things (runs at 50hz even if you're not focused on this [Page](#) (only drawn page gets touch updates))*
- virtual void [draw](#) (vex::brain::lcd &screen, bool first\_draw, unsigned int frame\_number)  
*draw stored data to the screen (runs at 10 hz and only runs if this page is in front)*

#### 5.61.1 Detailed Description

[Page](#) describes one part of the screen slideshow.

#### 5.61.2 Member Function Documentation

##### [draw\(\)](#)

```
virtual void screen::Page::draw (
    vex::brain::lcd & screen,
    bool first_draw,
    unsigned int frame_number) [virtual]
```

draw stored data to the screen (runs at 10 hz and only runs if this page is in front)

##### Parameters

<i>first_draw</i>	true if we just switched to this page
<i>frame_number</i>	frame of drawing we are on (basically an animation tick)

Reimplemented in [screen::FunctionPage](#), [screen::OdometryPage](#), [screen::PIDPage](#), and [screen::StatsPage](#).

##### [update\(\)](#)

```
virtual void screen::Page::update (
    bool was_pressed,
    int x,
    int y) [virtual]
```

collect data, respond to screen input, do fast things (runs at 50hz even if you're not focused on this [Page](#) (only drawn page gets touch updates))

**Parameters**

<i>was_pressed</i>	true if the screen has been pressed
<i>x</i>	x position of screen press (if the screen was pressed)
<i>y</i>	y position of screen press (if the screen was pressed)

Reimplemented in [screen::FunctionPage](#), [screen::OdometryPage](#), [screen::PIDPage](#), and [screen::StatsPage](#).

The documentation for this class was generated from the following file:

- [screen.h](#)

## 5.62 Parallel Class Reference

[Parallel](#) runs multiple commands in parallel and waits for all to finish before continuing. if none finish before this command's timeout, it will call `on_timeout` on all children continue.

```
#include <auto_command.h>
```

### 5.62.1 Detailed Description

[Parallel](#) runs multiple commands in parallel and waits for all to finish before continuing. if none finish before this command's timeout, it will call `on_timeout` on all children continue.

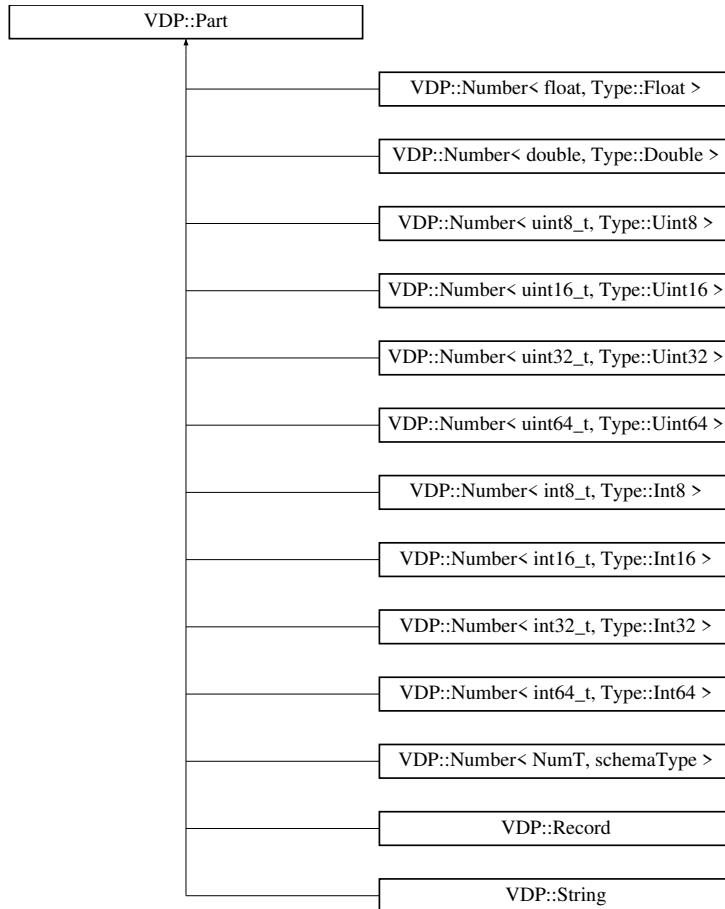

The documentation for this class was generated from the following files:

- [auto\\_command.h](#)
- [auto\\_command.cpp](#)

## 5.63 VDP::Part Class Reference

```
#include <protocol.hpp>
```

Inheritance diagram for VDP::Part:

## Public Member Functions

- [Part](#) (std::string name)
- std::string [pretty\\_print](#) () const
- std::string [pretty\\_print\\_data](#) () const
- virtual void [read\\_data\\_from\\_message](#) (PacketReader &reader)=0

## Protected Member Functions

- virtual void [write\\_schema](#) (PacketWriter &sofar) const =0
- virtual void [write\\_message](#) (PacketWriter &sofar) const =0
- virtual void [pprint](#) (std::stringstream &ss, size\_t indent) const =0
- virtual void [pprint\\_data](#) (std::stringstream &ss, size\_t indent) const =0

### 5.63.1 Detailed Description

defines a [Part](#), which has a name and contains data essentially defines data formatted so that it can be sent to the debug board

### 5.63.2 Constructor & Destructor Documentation

#### [Part\(\)](#)

```
VDP::Part::Part (
    std::string name)
```

Creates a [Part](#) with a name a part is essentially data formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	name for the <a href="#">Part</a>
-------------	-----------------------------------

**5.63.3 Member Function Documentation****pprint()**

```
virtual void VDP::Part::pprint (
    std::stringstream & ss,
    size_t indent) const [protected], [pure virtual]
```

changes a stringstream to a specified format, meant to be overrided

**Parameters**

<i>ss</i>	the stream of strings to change
<i>indent</i>	the amount of double spaced indents to add to the string

Implemented in [VDP::Number< NumT, schemaType >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), and [VDP::String](#).

**pprint\_data()**

```
virtual void VDP::Part::pprint_data (
    std::stringstream & ss,
    size_t indent) const [protected], [pure virtual]
```

changes a stringstream to the contain the [Part](#)'s data in a specified format, meant to be overrided

**Parameters**

<i>ss</i>	the stream of strings to change
<i>indent</i>	the amount of double spaced indents to add to the string

Implemented in [VDP::Number< NumT, schemaType >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), and [VDP::String](#).

**pretty\_print()**

```
std::string VDP::Part::pretty_print () const
```

**Returns**

a string of the [Part](#) with the format "name: string"  
 a stringstream of the [Part](#) with the format "name: string"

**pretty\_print\_data()**

```
std::string VDP::Part::pretty_print_data () const
```

**Returns**

a string of the [Part](#)'s data with the format "name: value"  
 a stringstream of the [Part](#)'s data with the format "name: value"

**read\_data\_from\_message()**

```
virtual void VDP::Part::read_data_from_message (
    PacketReader & reader) [pure virtual]
```

sets the data the part contains to the data from a packet, meant to be overrided

**Parameters**

<i>reader</i>	the PacketReader to read data from
---------------	------------------------------------

Implemented in [VDP::Number< NumT, schemaType >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Record](#), and [VDP::String](#).

**write\_message()**

```
virtual void VDP::Part::write_message (
    PacketWriter & sofar) const [protected], [pure virtual]
```

writes the value of the [Part](#) to a packet so that it can be sent to the debug board

**Parameters**

<i>sofar</i>	the packet writer to write with
--------------	---------------------------------

Implemented in [VDP::Number< NumT, schemaType >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Record](#), and [VDP::String](#).

### **write\_schema()**

```
virtual void VDP::Part::write_schema (
    PacketWriter & sofar) const [protected], [pure virtual]
```

writes the [Part](#) schematic to a packet so that it can be sent to the debug board, meant to be overrided

#### Parameters

<b>sofar</b>	the packet writer to write with
--------------	---------------------------------

Implemented in [VDP::Number< NumT, schemaType >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< double, Type::Double >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< float, Type::Float >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int16\\_t, Type::Int16 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int32\\_t, Type::Int32 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int64\\_t, Type::Int64 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< int8\\_t, Type::Int8 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint16\\_t, Type::Uint16 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint32\\_t, Type::Uint32 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint64\\_t, Type::Uint64 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Number< uint8\\_t, Type::Uint8 >](#), [VDP::Record](#), and [VDP::String](#).

## 5.64 PurePursuit::Path Class Reference

```
#include <pure_pursuit.h>
```

#### Public Member Functions

- [Path \(std::vector< Translation2d > points, double radius\)](#)
- [const std::vector< Translation2d > get\\_points \(\)](#)
- [double get\\_radius \(\)](#)
- [bool is\\_valid \(\)](#)

### 5.64.1 Detailed Description

Wrapper for a vector of points, checking if any of the points are too close for pure pursuit

#### 5.64.2 Constructor & Destructor Documentation

##### **Path()**

```
PurePursuit::Path::Path (
    std::vector< Translation2d > points,
    double radius)
```

Create a [Path](#)

**Parameters**

<i>points</i>	the points that make up the path
<i>radius</i>	the lookahead radius for pure pursuit

**5.64.3 Member Function Documentation****get\_points()**

```
const std::vector< Translation2d > PurePursuit::Path::get_points ()
```

Get the points associated with this Path

**get\_radius()**

```
double PurePursuit::Path::get_radius ()
```

Get the radius associated with this Path

**is\_valid()**

```
bool PurePursuit::Path::is_valid ()
```

Get whether this path will behave as expected

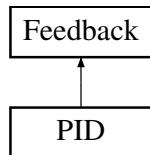

The documentation for this class was generated from the following files:

- pure\_pursuit.h
- pure\_pursuit.cpp

**5.65 PID Class Reference**

```
#include <pid.h>
```

Inheritance diagram for PID:

**Classes**

- struct [pid\\_config\\_t](#)

## Public Types

- double `get_error ()`
- double `get_output ()`
- double `get_target () const`
- void `set_target (double target)`

## Public Attributes

- `pid_config_t & config`

### 5.65.1 Detailed Description

#### PID Class

Defines a standard feedback loop using the constants kP, kI, kD, deadband, and on\_target\_time. The formula is:

$\text{out} = \text{kP} * \text{error} + \text{kI} * \text{integral}(\text{d Error}) + \text{kD} * (\text{dError}/\text{dt})$

The `PID` object will determine it is "on target" when the error is within the deadband, for a duration of on\_target\_time

#### Author

Ryan McGee

#### Date

4/3/2020

### 5.65.2 Member Enumeration Documentation

#### `ERROR_TYPE`

enum `PID::ERROR_TYPE`

An enum to distinguish between a linear and angular calculation of `PID` error.

### 5.65.3 Constructor & Destructor Documentation

#### `PID()`

```
PID::PID (
    pid_config_t & config)
```

Create the `PID` object

**Parameters**

<code>config</code>	the configuration data for this controller
---------------------	--

Create the [PID](#) object

#### 5.65.4 Member Function Documentation

**get()**

```
double PID::get () [override], [virtual]
```

Gets the current [PID](#) out value, from when [update\(\)](#) was last run

**Returns**

the Out value of the controller (voltage, RPM, whatever the [PID](#) controller is controlling)

Gets the current [PID](#) out value, from when [update\(\)](#) was last run

Implements [Feedback](#).

**get\_error()**

```
double PID::get_error ()
```

Get the delta between the current sensor data and the target

**Returns**

the error calculated. how it is calculated depends on error\_method specified in [pid\\_config\\_t](#)

Get the delta between the current sensor data and the target

**get\_output()**

```
double PID::get_output ()
```

Get the output calculated from the P, I, D and Error values

**Returns**

the output calculated from the pid controller specified in [pid\\_config\\_t](#)

Get the delta between the current sensor data and the target

**get\_sensor\_val()**

```
double PID::get_sensor_val () const
```

gets the sensor value that we were last updated with

**Returns**

```
sensor_val
```

**get\_target()**

```
double PID::get_target () const
```

Get the [PID](#)'s target

**Returns**

```
the target the PID controller is trying to achieve
```

**init()**

```
void PID::init (
    double start_pt,
    double set_pt) [override], [virtual]
```

Inherited from [Feedback](#) for interoperability. Update the setpoint and reset integral accumulation

start\_pt can be safely ignored in this feedback controller

**Parameters**

<i>start_pt</i>	completely ignored for <a href="#">PID</a> . necessary to satisfy <a href="#">Feedback</a> base
<i>set_pt</i>	sets the target of the <a href="#">PID</a> controller
<i>start_vel</i>	completely ignored for <a href="#">PID</a> . necessary to satisfy <a href="#">Feedback</a> base
<i>end_vel</i>	sets the target end velocity of the <a href="#">PID</a> controller

Implements [Feedback](#).

**is\_on\_target()**

```
bool PID::is_on_target () [override], [virtual]
```

Checks if the [PID](#) controller is on target.

**Returns**

```
true if the loop is within [deadband] for [on_target_time] seconds
```

Returns true if the loop is within [deadband] for [on\_target\_time] seconds

Implements [Feedback](#).

**reset()**

```
void PID::reset ()
```

Reset the [PID](#) loop by resetting time since 0 and accumulated error.

**set\_limits()**

```
void PID::set_limits (
    double lower,
    double upper) [override], [virtual]
```

Set the limits on the [PID](#) out. The [PID](#) out will "clip" itself to be between the limits.

**Parameters**

<i>lower</i>	the lower limit. the <a href="#">PID</a> controller will never command the output go below <i>lower</i>
<i>upper</i>	the upper limit. the <a href="#">PID</a> controller will never command the output go higher than <i>upper</i>

Set the limits on the [PID](#) out. The [PID](#) out will "clip" itself to be between the limits.

Implements [Feedback](#).

**set\_target()**

```
void PID::set_target (
    double target)
```

Set the target for the [PID](#) loop, where the robot is trying to end up

**Parameters**

<i>target</i>	the sensor reading we would like to achieve
---------------	---

Set the target for the [PID](#) loop, where the robot is trying to end up

**update() [1/2]**

```
double PID::update (
    double sensor_val) [override], [virtual]
```

Update the [PID](#) loop by taking the time difference from last update, and running the [PID](#) formula with the new sensor data

**Parameters**

<i>sensor_val</i>	the distance, angle, encoder position or whatever it is we are measuring
-------------------	--

**Returns**

the new output. What would be returned by [PID::get\(\)](#)

Implements [Feedback](#).

**update()** [2/2]

```
double PID::update (
    double sensor_val,
    double v_setpt)
```

Update the [PID](#) loop by taking the time difference from last update, and running the [PID](#) formula with the new sensor data

**Parameters**

<i>sensor_val</i>	the distance, angle, encoder position or whatever it is we are measuring
<i>v_setpt</i>	Expected velocity setpoint, to subtract from the D term (for velocity control)

**Returns**

the new output. What would be returned by [PID::get\(\)](#)

### 5.65.5 Member Data Documentation

**config**

```
pid_config_t& PID::config
```

configuration struct for this controller. see [pid\\_config\\_t](#) for information about what this contains

The documentation for this class was generated from the following files:

- pid.h
- pid.cpp

## 5.66 PID::pid\_config\_t Struct Reference

```
#include <pid.h>
```

**Public Attributes**

- double **p**  
*proportional coefficient p \* error()*
- double **i**  
*integral coefficient i \* integral(error)*
- double **d**  
*derivative coefficient d \* derivative(error)*
- double **deadband**  
*at what threshold are we close enough to be finished*
- double **on\_target\_time**
- [ERROR\\_TYPE](#) **error\_method**

### 5.66.1 Detailed Description

`pid_config_t` holds the configuration parameters for a pid controller In addition to the constant of proportional, integral and derivative, these parameters include:

- deadband -
- on\_target\_time - for how long do we have to be at the target to stop As well, `pid_config_t` holds an error type which determines whether errors should be calculated as if the sensor position is a measure of distance or an angle

### 5.66.2 Member Data Documentation

#### `error_method`

`ERROR_TYPE PID::pid_config_t::error_method`

Linear or angular. wheter to do error as a simple subtraction or to wrap

#### `on_target_time`

`double PID::pid_config_t::on_target_time`

the time in seconds that we have to be on target for to say we are officially at the target

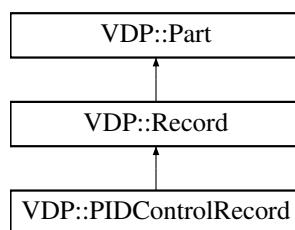

The documentation for this struct was generated from the following file:

- `pid.h`

## 5.67 VDP::PIDControlRecord Class Reference

```
#include <builtins.hpp>
```

Inheritance diagram for VDP::PIDControlRecord:

### Public Member Functions

- `std::string pretty_print_data () const`

**Additional Inherited Members****Protected Member Functions inherited from VDP::Record**

- `void write_schema (PacketWriter &sofar) const override`
- `void write_message (PacketWriter &sofar) const override`

**5.67.1 Detailed Description**

Defines a record for setting pid values from the board

**5.67.2 Constructor & Destructor Documentation****PIDControlRecord()**

```
VDP::PIDControlRecord::PIDControlRecord (
    std::string name,
    PID & pid)
```

Creates a record for setting pid values from the board

**Parameters**

<code>name</code>	the name of the record to create
<code>pid</code>	the pid to get data from

Defines a record for setting pid values from the board

### 5.67.3 Member Function Documentation

#### **response()**

```
void VDP::PIDControlRecord::response () [override], [virtual]
```

sets the [PID](#) values to the values from the board

Reimplemented from [VDP::Part](#).

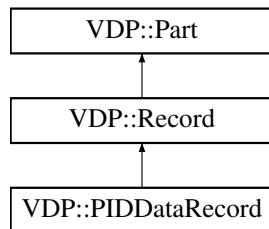

The documentation for this class was generated from the following files:

- [builtins.hpp](#)
- [builtins.cpp](#)

## 5.68 VDP::PIDDataRecord Class Reference

```
#include <builtins.hpp>
```

Inheritance diagram for VDP::PIDDataRecord:

- void [write\\_message](#) ([PacketWriter](#) &sofar) const override

### 5.68.1 Detailed Description

Defines a record that holds pid values to be sent to the board

### 5.68.2 Constructor & Destructor Documentation

#### [PIDDataRecord\(\)](#)

```
VDP::PIDDataRecord::PIDDataRecord (
    std::string name,
    PID & pid)
```

Creates a record that contains a Float of the pid P value Float of the pid I value Float of the pid D value Float of the pid error Float of the pid output [String](#) of the pid type (linear or angular)

#### Parameters

<i>name</i>	the name of the record to create
<i>pid</i>	the pid to get data from

### 5.68.3 Member Function Documentation

#### [fetch\(\)](#)

```
void VDP::PIDDataRecord::fetch () [override], [virtual]
```

sets the data that the [PID](#) Parts hold

sets the data that the [PID](#) Parts hold to be sent to the board

Implements [VDP::Part](#).

The documentation for this class was generated from the following files:

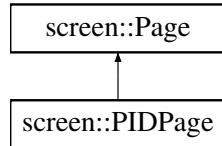

- [builtins.hpp](#)
- [builtins.cpp](#)

## 5.69 screen::PIDPage Class Reference

[PIDPage](#) provides a way to tune a pid controller on the screen.

```
#include <screen.h>
```

Inheritance diagram for screen::PIDPage:

### Public Member Functions

- [PIDPage](#) (`PID &pid, std::string name, std::function< void(void)> onchange=[ ]() {}`)  
Create a [PIDPage](#).
- void [update](#) (bool was\_pressed, int x, int y) override
- void [draw](#) (vex::brain::lcd &, bool first\_draw, unsigned int frame\_number) override

#### 5.69.1 Detailed Description

[PIDPage](#) provides a way to tune a pid controller on the screen.

#### 5.69.2 Constructor & Destructor Documentation

##### [PIDPage\(\)](#)

```
screen::PIDPage::PIDPage (
    PID & pid,
    std::string name,
    std::function< void(void)> onchange = [ ]() {})
```

Create a [PIDPage](#).

##### Parameters

<code>pid</code>	the pid controller we're changing
<code>name</code>	a name to recognize this pid controller if we've got multiple pid screens
<code>onchange</code>	a function that is called when a tuning parameter is changed. If you need to update stuff on that change register a handler here

### 5.69.3 Member Function Documentation

#### **draw()**

```
void screen::PIDPage::draw (
    vex::brain::lcd & scr,
    bool first_draw,
    unsigned int frame_number) [override], [virtual]
```

#### See also

[Page::draw](#)

Reimplemented from [screen::Page](#).

#### **update()**

```
void screen::PIDPage::update (
    bool was_pressed,
    int x,
    int y) [override], [virtual]
```

#### See also

[Page::update](#)

Reimplemented from [screen::Page](#).

The documentation for this class was generated from the following files:

- [screen.h](#)
- [screen.cpp](#)

## 5.70 Pose2d Class Reference

**Friends**

- std::ostream & [operator<<](#) (std::ostream &os, const [Pose2d](#) &pose)

**5.70.1 Detailed Description**

Class representing a pose in 2d space with x, y, and rotational components

Assumes conventional cartesian coordinate system: Looking down at the coordinate plane, +X is right +Y is up  
+Theta is counterclockwise

**5.70.2 Constructor & Destructor Documentation****Pose2d()** [1/6]

```
Pose2d::Pose2d () [inline], [constexpr]
```

Default Constructor for [Pose2d](#)

**Pose2d()** [2/6]

```
Pose2d::Pose2d (
    const Translation2d & translation,
    const Rotation2d & rotation)
```

Constructs a pose with given translation and rotation components.

**Parameters**

<i>translation</i>	translational component.
<i>rotation</i>	rotational component.

**Pose2d()** [3/6]

```
Pose2d::Pose2d (
    const double & x,
    const double & y,
    const Rotation2d & rotation)
```

Constructs a pose with given translation and rotation components.

**Parameters**

<i>x</i>	x component.
<i>y</i>	y component.
<i>rotation</i>	rotational component.

**Pose2d()** [4/6]

```
Pose2d::Pose2d (
    const double & x,
    const double & y,
    const double & radians)
```

Constructs a pose with given translation and rotation components.

**Parameters**

<i>x</i>	x component.
<i>y</i>	y component.
<i>radians</i>	rotational component in radians.

**Pose2d() [5/6]**

```
Pose2d::Pose2d (
    const Translation2d & translation,
    const double & radians)
```

Constructs a pose with given translation and rotation components.

**Parameters**

<i>translation</i>	translational component.
<i>radians</i>	rotational component in radians.

**Pose2d() [6/6]**

```
Pose2d::Pose2d (
    const Eigen::Vector3d & pose_vector)
```

Constructs a pose with given translation and rotation components.

**Parameters**

<i>pose_vector</i>	vector of the form [x, y, theta].
--------------------	-----------------------------------

### 5.70.3 Member Function Documentation

**exp()**

```
Pose2d Pose2d::exp (
    const Twist2d & twist) const
```

Applies a twist (pose delta) to a pose by including first order dynamics of heading.

When applying a twist, imagine a constant angular velocity, the translational components must be rotated into the global frame at every point along the twist, simply adding the deltas does not do this, and using euler integration results in some error. This is the analytic solution to that problem.

Can also be thought of more simply as applying a twist as following an arc rather than a straight line.

See this document for more information on the pose exponential and its derivation. <https://file.tavsys.net/control/controls-engineering-in-frc.pdf#section.10.2>

**Parameters**

<i>old_pose</i>	The pose to which the twist will be applied.
<i>twist</i>	The twist, represents a pose delta.

**Returns**

new pose that has been moved forward according to the twist.

**log()**

```
Twist2d Pose2d::log (
    const Pose2d & end_pose) const
```

The inverse of the pose exponential.

Determines the twist required to go from this pose to the given end pose. suppose you have `Pose2d` a, `Twist2d` twist if  $a \cdot \exp(\text{twist}) = b$  then  $a \cdot \log(b) = \text{twist}$

**Parameters**

<i>end_pose</i>	the end pose to find the mapping to.
-----------------	--------------------------------------

**Returns**

the twist required to go from this pose to the given end

**operator\*()**

```
Pose2d Pose2d::operator* (
    const double & scalar) const
```

Multiplies this pose by a scalar. Simply multiplies each component.

**Parameters**

<i>scalar</i>	the scalar value to multiply by.
---------------	----------------------------------

**operator+()**

```
Pose2d Pose2d::operator+ (
    const Transform2d & transform) const
```

Adds a transform to this pose. Transforms the pose in the pose's frame.

**Parameters**

<i>transform</i>	the change in pose.
------------------	---------------------

**operator-()**

```
Transform2d Pose2d::operator- (
    const Pose2d & other) const
```

Subtracts one pose from another to find the transform between them.

**Parameters**

<i>other</i>	the pose to subtract.
--------------	-----------------------

**operator/()**

```
Pose2d Pose2d::operator/ (
    const double & scalar) const
```

Divides this pose by a scalar. Simply divides each component.

**Parameters**

<i>scalar</i>	the scalar value to divide by.
---------------	--------------------------------

**operator==( )**

```
bool Pose2d::operator== (
    const Pose2d other) const
```

Compares this to another pose.

**Parameters**

<i>other</i>	the other pose to compare to.
--------------	-------------------------------

**Returns**

true if each of the components are within 1e-9 of each other.

**relative\_to()**

```
Pose2d Pose2d::relative_to (
    const Pose2d & other) const
```

Finds the pose equivalent to this pose relative to another arbitrary pose rather than the origin.

**Parameters**

<i>other</i>	the pose representing the new origin.
--------------	---------------------------------------

**Returns**

this pose relative to another pose.

**rotation()**

```
Rotation2d Pose2d::rotation () const
```

Returns the rotational component.

**Returns**

the rotational component.

**setRotationDeg()**

```
void Pose2d::setRotationDeg (
    double rotDeg)
```

sets the ration value of the rotational component in Degrees

**setRotationRad()**

```
void Pose2d::setRotationRad (
    double rotRad)
```

sets the ration value of the rotational component in Radians

**transform\_by()**

```
Pose2d Pose2d::transform_by (
    const Transform2d & transform) const
```

Adds a transform to this pose. Simply adds each component.

**Parameters**

<i>transform</i>	the change in pose.
------------------	---------------------

**Returns**

the pose after being transformed.

**translation()**

```
Translation2d Pose2d::translation () const
```

Returns the translational component.

**Returns**

the translational component.

**x()**

```
double Pose2d::x () const
```

Returns the x value of the translational component.

**Returns**

the x value of the translational component.

**y()**

```
double Pose2d::y () const
```

Returns the y value of the translational component.

**Returns**

the y value of the translational component.

#### 5.70.4 Friends And Related Symbol Documentation

**operator<<**

```
std::ostream & operator<< (
    std::ostream & os,
    const Pose2d & pose) [friend]
```

Sends a pose to an output stream. Ex. std::cout << pose;

prints "Pose2d[x: (value), y: (value), rad: (radians), deg: (degrees)]"

The documentation for this class was generated from the following files:

- pose2d.h
- pose2d.cpp

## 5.71 PurePursuitCommand Class Reference

```
#include <drive_commands.h>
```

### Public Member Functions

- `PurePursuitCommand (TankDrive &drive_sys, Feedback &feedback, PurePursuit::Path path, directionType dir, double max_speed=1, double end_speed=0)`
- `bool run () override`
- `void on_timeout () override`

#### 5.71.1 Detailed Description

Autocommand wrapper class for pure pursuit function in the [TankDrive](#) class

#### 5.71.2 Constructor & Destructor Documentation

##### PurePursuitCommand()

```
PurePursuitCommand::PurePursuitCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    PurePursuit::Path path,
    directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

Construct a Pure Pursuit AutoCommand

##### Parameters

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>feedback</i>	The feedback controller determining speed
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)

#### 5.71.3 Member Function Documentation

##### on\_timeout()

```
void PurePursuitCommand::on_timeout () [override]
```

Reset the drive system when it times out

**run()**

```
bool PurePursuitCommand::run () [override]
```

Direct call to [TankDrive::pure\\_pursuit](#)

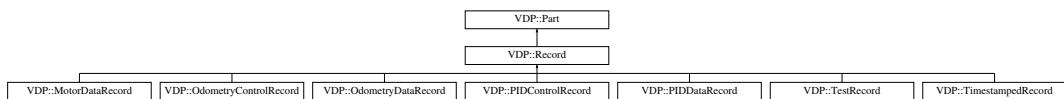

The documentation for this class was generated from the following files:

- [drive\\_commands.h](#)
- [drive\\_commands.cpp](#)

## 5.72 VDP::Record Class Reference

```
#include <types.hpp>
```

Inheritance diagram for VDP::Record:

### Public Member Functions

- [Record \(std::string name\)](#)
- [Record \(std::string name, const std::vector< Part \\* > &parts\)](#)
- [Record \(std::string name, std::vector< PartPtr > parts\)](#)
- [Record \(std::string name, PacketReader &reader\)](#)
- [void set\\_fields \(std::vector< PartPtr > fields\)](#)
- [void fetch \(\) override](#)
- [void read\\_data\\_from\\_message \(PacketReader &reader\) override](#)

### Public Member Functions inherited from VDP::Part

- [Part \(std::string name\)](#)
- [std::string pretty\\_print \(\) const](#)
- [std::string pretty\\_print\\_data \(\) const](#)

### Protected Member Functions

- [void write\\_schema \(PacketWriter &sofar\) const override](#)
- [void write\\_message \(PacketWriter &sofar\) const override](#)

#### 5.72.1 Detailed Description

Defines a [Part](#) that contains another [Part](#) essentially an array of parts that is formatted so that it can be sent to the debug board

#### 5.72.2 Constructor & Destructor Documentation

##### **Record()** [1/4]

```
VDP::Record::Record (
    std::string name) [explicit]
```

Creates a [Record](#) with just a name a [Record](#) is essentially an array of parts that is formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	the name for the part
-------------	-----------------------

**Record()** [2/4]

```
VDP::Record::Record (
    std::string name,
    const std::vector< Part * > & parts)
```

Creates a [Record](#) with a name that contains the Parts inside a vector of Parts a [Record](#) is essentially an array of parts that is formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	the name for the part
<i>parts</i>	the vector of Parts for the record to hold

**Record()** [3/4]

```
VDP::Record::Record (
    std::string name,
    std::vector< PartPtr > parts)
```

Creates a [Record](#) with a name that contains the Parts inside a vector of [Part](#) Pointers a [Record](#) is essentially an array of parts that is formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	the name for the part
<i>parts</i>	the vector of <a href="#">Part</a> Pointers for the record to hold

Creates a [Record](#) with a name that contains the Parts inside a vector of [Part](#) Pointers a [Record](#) is essentially an array of parts that is formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	the name for the <a href="#">Record</a>
<i>parts</i>	the vector of <a href="#">Part</a> Pointers for the record to hold

**Record()** [4/4]

```
VDP::Record::Record (
    std::string name,
    PacketReader & reader)
```

Creates a record with a name based off of a packet read by a [PacketReader](#) a [Record](#) is essentially an array of parts that is formatted so that it can be sent to the debug board

**Parameters**

<i>name</i>	
<i>reader</i>	

### 5.72.3 Member Function Documentation

**fetch()**

```
void VDP::Record::fetch () [override], [virtual]
```

sets the values of each [Part](#) the [Record](#) contains

Implements [VDP::Part](#).

Reimplemented in [VDP::TimestampedRecord](#).

**read\_data\_from\_message()**

```
void VDP::Record::read_data_from_message (
    PacketReader & reader) [override], [virtual]
```

writes a message to the packet containing part record

**Parameters**

<i>sofar</i>	the <a href="#">PacketWriter</a> to write with
--------------	--

Implements [VDP::Part](#).

**set\_fields()**

```
void VDP::Record::set_fields (
    std::vector< PartPtr > fs)
```

sets the [Record](#) to contain Parts from a part Pointer

**Parameters**

<i>fs</i>	the vector of <a href="#">Part</a> Pointers for the record to hold
-----------	--

**write\_message()**

```
void VDP::Record::write_message (
    PacketWriter & sofar) const [override], [protected], [virtual]
```

writes a message to the packet containing part record

**Parameters**

<code>sofar</code>	the <a href="#">PacketWriter</a> to write with
--------------------	--

Implements [VDP::Part](#).

**write\_schema()**

```
void VDP::Record::write_schema (
    PacketWriter & sofar) const [override], [protected], [virtual]
```

writes the [Record](#) as the

Implements [VDP::Part](#).

The documentation for this class was generated from the following files:

- [types.hpp](#)
- [types.cpp](#)

**5.73 Rect Struct Reference**

```
#include <geometry.h>
```

**5.73.1 Detailed Description**

Describes a Rectangle with a minimum and maximum point

The documentation for this struct was generated from the following file:

- [geometry.h](#)

**5.74 VDP::RegistryListener< MutexType > Class Template Reference**

```
#include <registry-listener.hpp>
```

**Public Member Functions**

- [RegistryListener](#) ([AbstractDevice](#) \*device)
- void [take\\_packet](#) (const [Packet](#) &pac)
 

*Call this if you are a device who has a packet for the protocol to decode.*
- bool [submit\\_response](#) ([PacketType](#) type, [ChannelID](#) id, [PartPtr](#) data)
 

*Submits a channel to respond to the board with.*
- void [install\\_broadcast\\_callback](#) ([CallbackFn](#) on\_broadcastf)
- void [install\\_data\\_callback](#) ([CallbackFn](#) on\_dataf)
- bool [send\\_data](#) ([ChannelID](#) id, [PartPtr](#) data)

### 5.74.1 Detailed Description

```
template<typename MutexType>
class VDP::RegistryListener< MutexType >
```

defines a device registry for sending data or listening to data over a device

### 5.74.2 Constructor & Destructor Documentation

#### RegistryListener()

```
template<typename MutexType>
VDP::RegistryListener< MutexType >::RegistryListener (
    AbstractDevice * device) [inline]
```

creates a device registry for sending data or listening to data over the device

##### Parameters

<i>device</i>	the device to send data to
<i>reg_type</i>	the type of registry it is (Listener or Controller)

### 5.74.3 Member Function Documentation

#### install\_broadcast\_callback()

```
template<typename MutexType>
void VDP::RegistryListener< MutexType >::install_broadcast_callback (
    CallbackFn on_broadcastf) [inline]
```

installs a callback to a function that is called when the registry broadcasts the data schematic

##### Parameters

<i>on_broadcastf</i>	the callback to run when the registry broadcasts the schematic
----------------------	--

#### install\_data\_callback()

```
template<typename MutexType>
void VDP::RegistryListener< MutexType >::install_data_callback (
    CallbackFn on_dataf) [inline]
```

installs a callback to a function that is called when the registry broadcasts data

##### Parameters

<i>on_dataf</i>	the callback to run when the registry broadcasts data
-----------------	---

#### send\_data()

```
template<typename MutexType>
bool VDP::RegistryListener< MutexType >::send_data (
    ChannelID id,
    PartPtr data) [inline]
```

sets the data at the channel id to a [Part](#) Pointer and sends it to the device

**Parameters**

<i>id</i>	The id of the channel to hold the data
<i>data</i>	the <a href="#">Part</a> Pointer for the channel to hold and send to the device

**submit\_response()**

```
template<typename MutexType>
bool VDP::RegistryListener< MutexType >::submit_response (
    PacketType type,
    ChannelID id,
    PartPtr data) [inline]
```

Submits a channel to respond to the board with.

**Parameters**

<i>id</i>	the channel id to respond with
-----------	--------------------------------

**Returns**

if the channel was submitted successfully or not

**take\_packet()**

```
template<typename MutexType>
void VDP::RegistryListener< MutexType >::take_packet (
    const Packet & pac) [inline]
```

Call this if you are a device who has a packet for the protocol to decode.

**Parameters**

<i>pac</i>	the packet to take.
------------	---------------------

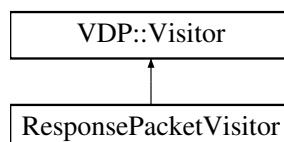

The documentation for this class was generated from the following file:

- [registry-listener.hpp](#)

**5.75 ResponsePacketVisitor Class Reference**

```
#include <visitor.hpp>
```

Inheritance diagram for ResponsePacketVisitor:

## Public Member Functions

- void [VisitUint8](#) (VDP::Uint8 \**Uint8\_part*) override

### 5.75.1 Detailed Description

Class for visiting parts from a response packet and modifying the parts we have in response to the packet essentially takes the response data and moves it into our data

### 5.75.2 Constructor & Destructor Documentation

#### [ResponsePacketVisitor\(\)](#)

```
ResponsePacketVisitor::ResponsePacketVisitor (
    VDP::PartPtr from_part)
```

Class for visiting parts from a response packet and modifying the parts we have in response to the packet essentially takes the response data and moves it into our data

#### Parameters

<i>from_part</i>	the part with the data we want to merge with our data
------------------	---

### 5.75.3 Member Function Documentation

#### [VisitDouble\(\)](#)

```
void ResponsePacketVisitor::VisitDouble (
    VDP::Double * double_part) [override], [virtual]
```

checks if the value is the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitFloat()**

```
void ResponsePacketVisitor::VisitFloat (
    VDP::Float * float_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitInt16()**

```
void ResponsePacketVisitor::VisitInt16 (
    VDP::Int16 * int16_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitInt32()**

```
void ResponsePacketVisitor::VisitInt32 (
    VDP::Int32 * int32_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitInt64()**

```
void ResponsePacketVisitor::VisitInt64 (
    VDP::Int64 * int64_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitInt8()**

```
void ResponsePacketVisitor::VisitInt8 (
    VDP::Int8 * int8_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitRecord()**

```
void ResponsePacketVisitor::VisitRecord (
    VDP::Record * record) [override], [virtual]
```

essentially just calls the same visitor on all the parts inside the record

Implements [VDP::Visitor](#).

**VisitString()**

```
void ResponsePacketVisitor::VisitString (
    VDP::String * str) [override], [virtual]
```

Checks if the string has the value N/A, if it does skip it otherwise replace our data with the new string

Implements [VDP::Visitor](#).

**VisitUint16()**

```
void ResponsePacketVisitor::VisitUint16 (
    VDP::Uint16 * Uint16_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitUint32()**

```
void ResponsePacketVisitor::VisitUint32 (
    VDP::Uint32 * Uint32_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitUint64()**

```
void ResponsePacketVisitor::VisitUint64 (
    VDP::Uint64 * Uint64_part) [override], [virtual]
```

checks if the value if the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

**VisitUint8()**

```
void ResponsePacketVisitor::VisitUint8 (
    VDP::Uint8 * Uint8_part) [override], [virtual]
```

checks if the value is the lowest possible number it can be, if it is skip it otherwise replace our datw with the new number

Implements [VDP::Visitor](#).

The documentation for this class was generated from the following files:

- visitor.cpp

**5.76 `robot_specs_t` Struct Reference**

```
#include <robot_specs.h>
```

**Public Attributes**

- double **robot\_radius**  
*if you were to draw a circle with this radius, the robot would be entirely contained within it*
- double **odom\_wheel\_diam**  
*the diameter of the wheels used for*
- double **odom\_gear\_ratio**  
*the ratio of the odometry wheel to the encoder reading odometry data*
- double **dist\_between\_wheels**  
*the distance between centers of the central drive wheels*
- double **drive\_correction\_cutoff**
- [Feedback](#) \* **drive\_feedback**  
*the default feedback for autonomous driving*
- [Feedback](#) \* **turn\_feedback**  
*the defualt feedback for autonomous turning*
- [PID::pid\\_config\\_t](#) **correction\_pid**  
*the pid controller to keep the robot driving in as straight a line as possible*

**5.76.1 Detailed Description**

Main robot characterization struct. This will be passed to all the major subsystems that require info about the robot. All distance measurements are in inches.

**5.76.2 Member Data Documentation****drive\_correction\_cutoff**

```
double robot_specs_t::drive_correction_cutoff
```

the distance at which to stop trying to turn towards the target. If we are less than this value, we can continue driving forward to minimize our distance but will not try to spin around to point directly at the target

The documentation for this struct was generated from the following file:

- robot\_specs.h

### Friends

- `std::ostream & operator<< (std::ostream &os, const Rotation2d &rotation)`

### 5.77.1 Detailed Description

Class representing a rotation in 2d space. Stores theta in radians, as well as cos and sin.

Internally this angle is stored continuously, however there are functions that return wrapped angles: "180" is from [-pi, pi), [-180, 180), [-0.5, 0.5) "360" is from [0, 2pi), [0, 360), [0, 1)

### 5.77.2 Constructor & Destructor Documentation

#### Rotation2d() [1/4]

```
Rotation2d::Rotation2d () [inline], [constexpr]
```

Default Constructor for `Rotation2d`

#### Rotation2d() [2/4]

```
Rotation2d::Rotation2d (  
    const double & radians)
```

Constructs a rotation with the given value in radians.

**Parameters**

<i>radians</i>	the value of the rotation in radians.
----------------	---------------------------------------

**Rotation2d() [3/4]**

```
Rotation2d::Rotation2d (
    const double & x,
    const double & y)
```

Constructs a rotation given x and y values. Does not have to be normalized. The angle from the x axis to the point.

$$[\theta] = [\text{atan2}(y, x)]$$

**Parameters**

<i>x</i>	the x value of the point
<i>y</i>	the y value of the point

**Rotation2d() [4/4]**

```
Rotation2d::Rotation2d (
    const Translation2d & translation)
```

Constructs a rotation given x and y values in the form of a [Translation2d](#). Does not have to be normalized. The angle from the x axis to the point.

$$[\theta] = [\text{atan2}(y, x)]$$

**Parameters**

<i>translation</i>	
--------------------	--

**5.77.3 Member Function Documentation****degrees()**

```
double Rotation2d::degrees () const
```

Returns the degree angle value.

**Returns**

the degree angle value.

**f\_cos()**

```
double Rotation2d::f_cos () const
```

Returns the cosine of the angle value.

**Returns**

the cosine of the angle value

**f\_sin()**

```
double Rotation2d::f_sin () const
```

Returns the sine of the angle value.

**Returns**

the sine of the angle value.

**f\_tan()**

```
double Rotation2d::f_tan () const
```

Returns the tangent of the angle value.

**Returns**

the tangent of the angle value.

**operator\*()**

```
Rotation2d Rotation2d::operator* (
    const double & scalar) const
```

Multiplies this rotation by a scalar.

**Parameters**

<code>scalar</code>	the scalar value to multiply the rotation by.
---------------------	---

**Returns**

the rotation multiplied by the scalar.

**operator+()**

```
Rotation2d Rotation2d::operator+ (
    const Rotation2d & other) const
```

Adds the values of two rotations using a rotation matrix

[new\_cos] = [other.cos, -other.sin][cos] [new\_sin] = [other.sin, other.cos][sin] new\_value = atan2(new\_sin, new\_cos)

**Parameters**

<i>other</i>	the other rotation to add to this rotation.
--------------	---

**Returns**

the sum of the two rotations.

Adds the values of two rotations using a rotation matrix.

[new\_cos] = [other.cos, -other.sin][cos] [new\_sin] = [other.sin, other.cos][sin] new\_value = atan2(new\_sin, new\_cos)

**Parameters**

<i>other</i>	the other rotation to add to this rotation.
--------------	---

**Returns**

the sum of the two rotations.

**operator-() [1/2]**

`Rotation2d` `Rotation2d::operator- () const`

Takes the inverse of this rotation by flipping it. Equivalent to adding 180 degrees.

**Returns**

this inverse of the rotation.

Takes the inverse of this rotation by flipping it.

**Returns**

this inverse of the rotation.

**operator-() [2/2]**

`Rotation2d` `Rotation2d::operator- (`  
`const Rotation2d & other) const`

Subtracts the values of two rotations.

**Parameters**

<i>other</i>	the other rotation to subtract from this rotation.
--------------	--

**Returns**

the difference between the two rotations.

**operator/()**

`Rotation2d` `Rotation2d::operator/ (`  
`const double & scalar) const`

Divides this rotation by a scalar.

**Parameters**

<i>scalar</i>	the scalar value to divide the rotation by.
---------------	---

**Returns**

the rotation divided by the scalar.

**operator==()**

```
bool Rotation2d::operator== (
    const Rotation2d & other) const
```

Compares two rotations. Returns true if their values are within 1e-9 radians of each other, to account for floating point error.

**Parameters**

<i>other</i>	the other rotation to compare to
--------------	----------------------------------

**Returns**

whether the values of the rotations are within 1e-9 radians of each other

**radians()**

```
double Rotation2d::radians () const
```

Returns the radian angle value.

**Returns**

the radian angle value.

**revolutions()**

```
double Rotation2d::revolutions () const
```

Returns the revolution angle value.

**Returns**

the revolution angle value.

**rotation\_matrix()**

```
Eigen::Matrix2d Rotation2d::rotation_matrix () const
```

Returns the rotation matrix equivalent to this rotation [cos, -sin] R = [sin, cos]

**Returns**

the rotation matrix equivalent to this rotation

**wrapped\_degrees\_180()**

```
double Rotation2d::wrapped_degrees_180 () const
```

Returns the degree angle value, wrapped from [-180, 180].

**Returns**

the degree angle value, wrapped from [-180, 180]

**wrapped\_degrees\_360()**

```
double Rotation2d::wrapped_degrees_360 () const
```

Returns the degree angle value, wrapped from [0, 360].

**Returns**

the degree angle value, wrapped from [0, 360]

**wrapped\_radians\_180()**

```
double Rotation2d::wrapped_radians_180 () const
```

Returns the radian angle value, wrapped from [-pi, pi].

**Returns**

the radian angle value, wrapped from [-pi, pi]

**wrapped\_radians\_360()**

```
double Rotation2d::wrapped_radians_360 () const
```

Returns the radian angle value, wrapped from [0, 2pi].

**Returns**

the radian angle value, wrapped from [0, 2pi)

**wrapped\_revolutions\_180()**

```
double Rotation2d::wrapped_revolutions_180 () const
```

Returns the revolution angle value, wrapped from [-0.5, 0.5).

**Returns**

the revolution angle value, wrapped from [-0.5, 0.5)

**wrapped\_revolutions\_360()**

```
double Rotation2d::wrapped_revolutions_360 () const
```

Returns the revolution angle value, wrapped from [0, 1).

**Returns**

the revolution angle value, wrapped from [0, 1)

**5.77.4 Friends And Related Symbol Documentation****operator<<**

```
std::ostream & operator<< (
    std::ostream & os,
    const Rotation2d & rotation) [friend]
```

Sends a rotation to an output stream. Ex. std::cout << rotation;

prints "Rotation2d[rad: (radians), deg: (degrees)]"

The documentation for this class was generated from the following files:

- rotation2d.h
- rotation2d.cpp

**5.78 ScaledSphericalSimplexSigmaPoints< STATES > Class Template Reference**

```
#include <unscented_kalman_filter.h>
```

**Public Member Functions**

- **ScaledSphericalSimplexSigmaPoints** (double alpha=0.001, double beta=2)
- int **num\_sigmas** ()
- EMat< STATES, NUM\_SIGMAS > **square\_root\_sigma\_points** (const EVec< STATES > &x, const EMat< STATES, STATES > &S)
- const EVec< NUM\_SIGMAS > & **Wm** () const
- const EVec< NUM\_SIGMAS > & **Wc** () const
- double **Wm** (int i) const
- double **Wc** (int i) const

### 5.78.1 Detailed Description

```
template<int STATES>
class ScaledSphericalSimplexSigmaPoints< STATES >
```

Generates sigma points and weights according to the paper [1] This is very different from Wan and Merwe's formulation.

This only requires  $N + 2$  sigma points instead of  $2N + 1$  sigma points. Rather than generating sigma points symmetrically around the mean, it generates them as vertices of an  $N$ -simplex.

The performance of the filter using this reduced set of sigma points is identical to the standard method, so there is no downside to using it here.

[1] A Scaled Spherical Simplex Filter (S3F) with a decreased  $n + 2$  sigma points set size and equivalent  $2n + 1$  Unscented Kalman Filter (UKF) accuracy

#### Template Parameters

<code>STATES</code>	the dimension of the state. NUM_SIGMAS sigma points and weights will be generated.
---------------------	--

### 5.78.2 Constructor & Destructor Documentation

#### ScaledSphericalSimplexSigmaPoints()

```
template<int STATES>
ScaledSphericalSimplexSigmaPoints< STATES >::ScaledSphericalSimplexSigmaPoints (
    double alpha = 0.001,
    double beta = 2) [inline]
```

Constructs a sigma point generator for Spherical Simplex sigma points

#### Parameters

<code>alpha</code>	Determines the spread of the sigma points around the mean. Smaller values are closer to the mean, this is usually a small value.
<code>beta</code>	Incorporates prior knowledge of the distribution of the state. For Gaussian distributions, beta = 2 is optimal.

### 5.78.3 Member Function Documentation

#### num\_sigmas()

```
template<int STATES>
int ScaledSphericalSimplexSigmaPoints< STATES >::num_sigmas () [inline]
```

Returns the number of sigma points, for simplex sigma points this is  $N+2$ .

#### square\_root\_sigma\_points()

```
template<int STATES>
EMat< STATES, NUM_SIGMAS > ScaledSphericalSimplexSigmaPoints< STATES >::square_root_sigma_points (
    const EVec< STATES > & x,
    const EMat< STATES, STATES > & S) [inline]
```

Computes the sigma points given a mean ( $x$ ) and square-root covariance ( $S$ ).

**Parameters**

<i>x</i>	Vector of the means.
<i>S</i>	Square-root covariance.

**Returns**

Matrix containing the sigma points. Each column contains one sigma point in the same space as *x*. The first column is the same as the mean, with the others arranged around the mean.

**Wc() [1/2]**

```
template<int STATES>
const EVec< NUM_SIGMAS > & ScaledSphericalSimplexSigmaPoints< STATES >::Wc () const [inline]
```

Returns a vector containing the weights of each sigma point for the covariance.

**Wc() [2/2]**

```
template<int STATES>
double ScaledSphericalSimplexSigmaPoints< STATES >::Wc (
    int i) const [inline]
```

Returns the weight for the *i*-th sigma point for the covariance.

**Parameters**

<i>i</i>	Element of the weights vector to return.
----------	--

**Wm() [1/2]**

```
template<int STATES>
const EVec< NUM_SIGMAS > & ScaledSphericalSimplexSigmaPoints< STATES >::Wm () const [inline]
```

Returns a vector containing the weights of each sigma point for the mean.

**Wm() [2/2]**

```
template<int STATES>
double ScaledSphericalSimplexSigmaPoints< STATES >::Wm (
    int i) const [inline]
```

Returns the weight for the *i*-th sigma point for the mean.

**Parameters**

<i>i</i>	Element of the weights vector to return.
----------	--

The documentation for this class was generated from the following file:

- unscented\_kalman\_filter.h

## 5.79 screen::ScreenData Struct Reference

The [ScreenData](#) class holds the data that will be passed to the screen thread you probably shouldnt have to use it.

### 5.79.1 Detailed Description

The [ScreenData](#) class holds the data that will be passed to the screen thread you probably shouldnt have to use it.

The documentation for this struct was generated from the following file:

- screen.cpp

## 5.80 Serializer Class Reference

Serializes Arbitrary data to a file on the SD Card.

```
#include <serializer.h>
```

### Public Member Functions

- **~Serializer ()**  
*Save and close upon destruction (bc of vex, this doesnt always get called when the program ends. To be sure, call save\_to\_disk)*
- **Serializer (const std::string &filename, bool flush\_always=true)**  
*create a Serializer*
- **void save\_to\_disk () const**  
*saves current Serializer state to disk*
- **void set\_int (const std::string &name, int i)**  
*Setters - not saved until save\_to\_disk is called.*
- **void set\_bool (const std::string &name, bool b)**  
*sets a bool by the name of name to b. If flush\_always == true, this will save to the sd card*
- **void set\_double (const std::string &name, double d)**  
*sets a double by the name of name to d. If flush\_always == true, this will save to the sd card*
- **void set\_string (const std::string &name, std::string str)**  
*sets a string by the name of name to s. If flush\_always == true, this will save to the sd card*
- **int int\_or (const std::string &name, int otherwise)**  
*gets a value stored in the serializer. If not found, sets the value to otherwise*
- **bool bool\_or (const std::string &name, bool otherwise)**  
*gets a value stored in the serializer. If not, sets the value to otherwise*
- **double double\_or (const std::string &name, double otherwise)**  
*gets a value stored in the serializer. If not, sets the value to otherwise*
- **std::string string\_or (const std::string &name, std::string otherwise)**  
*gets a value stored in the serializer. If not, sets the value to otherwise*

### 5.80.1 Detailed Description

Serializes Arbitrary data to a file on the SD Card.

## 5.80.2 Constructor & Destructor Documentation

### **Serializer()**

```
Serializer::Serializer (
    const std::string & filename,
    bool flush_always = true) [inline], [explicit]
```

create a [Serializer](#)

**Parameters**

<i>filename</i>	the file to read from. If filename does not exist we will create that file
<i>flush_always</i>	If true, after every write flush to a file. If false, you are responsible for calling <code>save_to_disk</code>

**5.80.3 Member Function Documentation****bool\_or()**

```
bool Serializer::bool_or (
    const std::string & name,
    bool otherwise)
```

gets a value stored in the serializer. If not, sets the value to otherwise

**Parameters**

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

**Returns**

the value if found or otherwise

**double\_or()**

```
double Serializer::double_or (
    const std::string & name,
    double otherwise)
```

gets a value stored in the serializer. If not, sets the value to otherwise

**Parameters**

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

**Returns**

the value if found or otherwise

**int\_or()**

```
int Serializer::int_or (
    const std::string & name,
    int otherwise)
```

gets a value stored in the serializer. If not found, sets the value to otherwise

Getters Return value if it exists in the serializer

**Parameters**

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

**Returns**

the value if found or otherwise

**save\_to\_disk()**

```
void Serializer::save_to_disk () const  
saves current Serializer state to disk  
forms data bytes then saves to filename this was opened with
```

**set\_bool()**

```
void Serializer::set_bool (  
    const std::string & name,  
    bool b)  
sets a bool by the name of name to b. If flush_always == true, this will save to the sd card
```

**Parameters**

<i>name</i>	name of bool
<i>b</i>	value of bool

**set\_double()**

```
void Serializer::set_double (  
    const std::string & name,  
    double d)  
sets a double by the name of name to d. If flush_always == true, this will save to the sd card
```

**Parameters**

<i>name</i>	name of double
<i>d</i>	value of double

**set\_int()**

```
void Serializer::set_int (  
    const std::string & name,  
    int i)  
Setters - not saved until save_to_disk is called.  
sets an integer by the name of name to i. If flush_always == true, this will save to the sd card
```

**Parameters**

<i>name</i>	name of integer
<i>i</i>	value of integer

**set\_string()**

```
void Serializer::set_string (
    const std::string & name,
    std::string str)
```

sets a string by the name of name to s. If flush\_always == true, this will save to the sd card

**Parameters**

<i>name</i>	name of string
<i>i</i>	value of string

**string\_or()**

```
std::string Serializer::string_or (
    const std::string & name,
    std::string otherwise)
```

gets a value stored in the serializer. If not, sets the value to otherwise

**Parameters**

<i>name</i>	name of value
<i>otherwise</i>	value if the name is not specified

**Returns**

the value if found or otherwise

The documentation for this class was generated from the following files:

- serializer.h
- serializer.cpp

**5.81 screen::SliderWidget Class Reference**

Widget that updates a double value. Updates by reference so watch out for race conditions cuz the screen stuff lives on another thread.

```
#include <screen.h>
```

## Public Member Functions

- **SliderWidget** (double &val, double low, double high, **Rect** rect, std::string name)  
*Creates a slider widget.*
- bool **update** (bool was\_pressed, int x, int y)  
*responds to user input*
- void **draw** (vex::brain::lcd &, bool first\_draw, unsigned int frame\_number)  
*Page::draws the slide to the screen*

### 5.81.1 Detailed Description

Widget that updates a double value. Updates by reference so watch out for race conditions cuz the screen stuff lives on another thread.

### 5.81.2 Constructor & Destructor Documentation

#### **SliderWidget()**

```
screen::SliderWidget::SliderWidget (
    double & val,
    double low,
    double high,
    Rect rect,
    std::string name) [inline]
```

Creates a slider widget.

##### Parameters

<i>val</i>	reference to the value to modify
<i>low</i>	minimum value to go to
<i>high</i>	maximum value to go to
<i>rect</i>	rect to draw it
<i>name</i>	name of the value

### 5.81.3 Member Function Documentation

#### **update()**

```
bool screen::SliderWidget::update (
    bool was_pressed,
    int x,
    int y)
```

responds to user input

##### Parameters

<i>was_pressed</i>	if the screen is pressed
<i>x</i>	x position if the screen was pressed
<i>y</i>	y position if the screen was pressed

**Returns**

true if the value updated

The documentation for this class was generated from the following files:

- screen.h
- screen.cpp

## 5.82 SpinRPMCommand Class Reference

```
#include <flywheel_commands.h>
```

### Public Member Functions

- [SpinRPMCommand \(Flywheel &flywheel, int rpm\)](#)
- bool [run \(\) override](#)

#### 5.82.1 Detailed Description

File: [flywheel\\_commands.h](#) Desc: [insert meaningful desc] AutoCommand wrapper class for the spin\_rpm function in the [Flywheel](#) class

#### 5.82.2 Constructor & Destructor Documentation

##### **SpinRPMCommand()**

```
SpinRPMCommand::SpinRPMCommand (
    Flywheel & flywheel,
    int rpm)
```

Construct a SpinRPM Command

###### Parameters

<i>flywheel</i>	the flywheel sys to command
<i>rpm</i>	the rpm that we should spin at

File: [flywheel\\_commands.cpp](#) Desc: [insert meaningful desc]

### 5.82.3 Member Function Documentation

#### run()

```
bool SpinRPMCommand::run () [override]
```

Run spin\_manual Overrides run from AutoCommand

##### Returns

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- flywheel\_commands.h
- flywheel\_commands.cpp

## 5.83 PurePursuit::spline Struct Reference

```
#include <pure_pursuit.h>
```

### 5.83.1 Detailed Description

Represents a piece of a cubic spline with  $s(x) = a(x-x_i)^3 + b(x-x_i)^2 + c(x-x_i) + d$ . The x\_start and x\_end shows where the equation is valid.

The documentation for this struct was generated from the following file:

- pure\_pursuit.h

## 5.84 StateMachine< System, IDType, Message, delay\_ms, do\_log >::State Struct Reference

```
#include <state_machine.h>
```

### 5.84.1 Detailed Description

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log = false>
struct StateMachine< System, IDType, Message, delay_ms, do_log >::State
```

Abstract class that all states for this machine must inherit from. States MUST override respond() and id() in order to function correctly (the compiler won't have it any other way)

The documentation for this struct was generated from the following file:

- state\_machine.h

## 5.85 StateMachine< System, IDType, Message, delay\_ms, do\_log > Class Template Reference

**State Machine :))))))** A fun fun way of controlling stateful subsystems - used in the 2023-2024 Over Under game for our overly complex intake-cata subsystem (see there for an example) The statemachine runs in a background thread and a user thread can interact with it through current\_state and send\_message.

```
#include <state_machine.h>
```

### Classes

- class [MaybeMessage](#)  
*MaybeMessage a message of Message type or nothing* `MaybeMessage m = {};` // empty `MaybeMessage m = Message::EnumField1.`
- struct [State](#)

### Public Member Functions

- [StateMachine \(State \\*initial\)](#)  
*Construct a state machine and immediately start running it.*
- [IDType current\\_state \(\) const](#)  
*retrieve the current state of the state machine. This is safe to call from external threads*
- [void send\\_message \(Message msg\)](#)  
*send a message to the state machine from outside*

#### 5.85.1 Detailed Description

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log = false>
class StateMachine< System, IDType, Message, delay_ms, do_log >
```

**State Machine :))))))** A fun fun way of controlling stateful subsystems - used in the 2023-2024 Over Under game for our overly complex intake-cata subsystem (see there for an example) The statemachine runs in a background thread and a user thread can interact with it through current\_state and send\_message.

Designwise: the System class should hold onto any motors, feedback controllers, etc that are persistent in the system States themselves should hold any data that *only* that state needs. For example if a state should be exited after a certain amount of time, it should hold a timer rather than the System holding that timer. (see Junder from 2024 for an example of this design)

### Template Parameters

<code>System</code>	The system that this is the base class of <code>class Thing : public StateMachine&lt;Thing&gt;</code> @tparam IDType The ID enum that recognizes states. Hint hint, use anenum class`
<code>Message</code>	the message enum that a state or an outside can send and that states respond to
<code>delay_ms</code>	the delay to wait between each state processing to allow other threads to work
<code>do_log</code>	true if you want print statements describing incoming messages and current states. If true, it is expected that IDType and Message have a function called <code>to_string</code> that takes them as its only parameter and returns a std::string

### 5.85.2 Constructor & Destructor Documentation

#### **StateMachine()**

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =  
false>  
StateMachine< System, IDType, Message, delay_ms, do_log >::StateMachine (   
    State * initial) [inline]
```

Construct a state machine and immediately start running it.

##### Parameters

<i>initial</i>	the state that the machine will begin in
----------------	--

### 5.85.3 Member Function Documentation

#### **current\_state()**

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =  
false>  
IDType StateMachine< System, IDType, Message, delay_ms, do_log >::current_state () const  
[inline]
```

retrieve the current state of the state machine. This is safe to call from external threads

##### Returns

the current state

#### **send\_message()**

```
template<typename System, typename IDType, typename Message, int32_t delay_ms, bool do_log =  
false>  
void StateMachine< System, IDType, Message, delay_ms, do_log >::send_message (   
    Message msg) [inline]
```

send a message to the state machine from outside

##### Parameters

<i>msg</i>	the message to send This is safe to call from external threads
------------	--

The documentation for this class was generated from the following file:

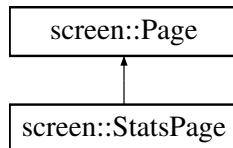

- state\_machine.h

## 5.86 screen::StatsPage Class Reference

Draws motor stats and battery stats to the screen.

```
#include <screen.h>
```

Inheritance diagram for screen::StatsPage:

### Public Member Functions

- [StatsPage](#) (`std::map< std::string, vex::motor & > motors`)  
*Creates a stats page.*
- void [update](#) (`bool was_pressed, int x, int y`) `override`
- void [draw](#) (`vex::brain::lcd &, bool first_draw, unsigned int frame_number`) `override`

#### 5.86.1 Detailed Description

Draws motor stats and battery stats to the screen.

#### 5.86.2 Constructor & Destructor Documentation

##### [StatsPage\(\)](#)

```
screen::StatsPage::StatsPage (
    std::map< std::string, vex::motor & > motors)
```

Creates a stats page.

###### Parameters

<code>motors</code>	a map of string to motor that we want to draw on this page
---------------------	--

#### 5.86.3 Member Function Documentation

##### [draw\(\)](#)

```
void screen::StatsPage::draw (
    vex::brain::lcd & scr,
    bool first_draw,
    unsigned int frame_number) [override], [virtual]
```

###### See also

[Page::draw](#)

Reimplemented from [screen::Page](#).

## update()

```
void screen::StatsPage::update (
    bool was_pressed,
    int x,
    int y) [override], [virtual]
```

### See also

[Page::update](#)

Reimplemented from [screen::Page](#).

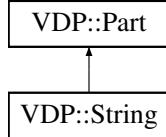

The documentation for this class was generated from the following files:

- [screen.cpp](#)

## 5.87 VDP::String Class Reference

```
#include <types.hpp>
```

Inheritance diagram for VDP::String:

### Public Member Functions

- [String \(std::string name, FetchFunc fetcher=\[\]{ return "no value";}\)](#)
- [void \*\*fetch\*\* \(\) override](#)
- [void \*\*response\*\* \(\) override](#)
- [void \*\*set\\_value\*\* \(std::string new\\_value\)](#)
- [std::string \*\*get\\_value\*\* \(\)](#)
- [void \*\*read\\_data\\_from\\_message\*\* \(PacketReader &reader\) override](#)
- [void \*\*pprint\*\* \(std::stringstream &ss, size\\_t indent\) const override](#)
- [void \*\*pprint\\_data\*\* \(std::stringstream &ss, size\\_t indent\) const override](#)

### Public Member Functions inherited from [VDP::Part](#)

- [Part \(std::string name\)](#)
- [std::string \*\*pretty\\_print\*\* \(\) const](#)
- [std::string \*\*pretty\\_print\\_data\*\* \(\) const](#)

### Protected Member Functions

- [void \*\*write\\_schema\*\* \(PacketWriter &sofar\) const override](#)
- [void \*\*write\\_message\*\* \(PacketWriter &sofar\) const override](#)

### 5.87.1 Detailed Description

A string type conveyed as a part

### 5.87.2 Constructor & Destructor Documentation

#### **String()**

```
VDP::String::String (
    std::string field_name,
    FetchFunc fetcher = []() { return "no value"; }) [explicit]
```

creates a string type conveyed as a part with a name and a fetcher

##### Parameters

<i>name</i>	name of the string to have
<i>fetcher</i>	the fetch function to use when running <a href="#">fetch()</a>

creates a string type conveyed as a part with a name and a fetcher

##### Parameters

<i>name</i>	name of the string to have
<i>fetcher</i>	the fetcher function to use when assigning it new data

### 5.87.3 Member Function Documentation

#### **fetch()**

```
void VDP::String::fetch () [override], [virtual]
```

function to run when fetching this part, runs the fetch function

used to assign the string new data, runs the fetch function

Implements [VDP::Part](#).

#### **get\_value()**

```
std::string VDP::String::get_value ()
```

##### Returns

the currently stored string

#### **pprint()**

```
void VDP::String::pprint (
    std::stringstream & ss,
    size_t indent) const [override], [virtual]
```

changes a stringstream to be formatted as name: string

**Parameters**

<i>ss</i>	the stringstream to change
<i>indent</i>	the amount of indents to use

Implements [VDP::Part](#).

**pprint\_data()**

```
void VDP::String::pprint_data (
    std::stringstream & ss,
    size_t indent) const [override], [virtual]
```

changes a stringstream to be formatted as name: value

**Parameters**

<i>ss</i>	the stringstream to change
<i>indent</i>	the amount of indents to use

Implements [VDP::Part](#).

**read\_data\_from\_message()**

```
void VDP::String::read_data_from_message (
    PacketReader & reader) [override], [virtual]
```

sets the string part's value to the string read by a packet reader

**Parameters**

<i>reader</i>	the packet reader to get the string from
---------------	--

sets the string part's value to the string read by a packet reader

**Parameters**

<i>reader</i>	the part reader to get
---------------	------------------------

Implements [VDP::Part](#).

**response()**

```
void VDP::String::response () [override], [virtual]
```

function to run when receiving to this part

Reimplemented from [VDP::Part](#).

**set\_value()**

```
void VDP::String::set_value (
    std::string new_value)
```

sets the string part's value to the string given

**Parameters**

<i>new_value</i>	the string to set the value to
------------------	--------------------------------

**write\_message()**

```
void VDP::String::write_message (
    PacketWriter & sofar) const [override], [protected], [virtual]
```

writes the strings data to a packet

**Parameters**

<i>sofar</i>	the packet writer to write with
--------------	---------------------------------

Implements [VDP::Part](#).

**write\_schema()**

```
void VDP::String::write_schema (
    PacketWriter & sofar) const [override], [protected], [virtual]
```

writes the schematic for the string to a packet

**Parameters**

<i>sofar</i>	the packet writer to write with
--------------	---------------------------------

Implements [VDP::Part](#).

The documentation for this class was generated from the following files:

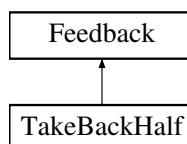

- types.hpp
- types.cpp

## 5.88 TakeBackHalf Class Reference

A velocity controller.

```
#include <take_back_half.h>
```

Inheritance diagram for TakeBackHalf:

## Public Member Functions

- void **init** (double start\_pt, double set\_pt)
- double **update** (double val) override
- double **get** () override
- void **set\_limits** (double lower, double upper) override
- bool **is\_on\_target** () override

## Public Attributes

- double **TBH\_gain**  
*tuned parameter*

### 5.88.1 Detailed Description

A velocity controller.

#### Warning

If you try to use this as a position controller, it will fail.

### 5.88.2 Member Function Documentation

#### **get()**

```
double TakeBackHalf::get () [override], [virtual]
```

#### Returns

the last saved result from the feedback controller

Implements [Feedback](#).

#### **init()**

```
void TakeBackHalf::init (
    double start_pt,
    double set_pt) [virtual]
```

Initialize the feedback controller for a movement

#### Parameters

<i>start_pt</i>	the current sensor value
<i>set_pt</i>	where the sensor value should be
<i>start_vel</i>	Movement starting velocity (IGNORED)
<i>end_vel</i>	Movement ending velocity (IGNORED)

Implements [Feedback](#).

**is\_on\_target()**

```
bool TakeBackHalf::is_on_target () [override], [virtual]
```

**Returns**

true if the feedback controller has reached it's setpoint

Implements [Feedback](#).

**set\_limits()**

```
void TakeBackHalf::set_limits (
    double lower,
    double upper) [override], [virtual]
```

Clamp the upper and lower limits of the output. If both are 0, no limits should be applied.

**Parameters**

<i>lower</i>	Upper limit
<i>upper</i>	Lower limit

Implements [Feedback](#).

**update()**

```
double TakeBackHalf::update (
    double val) [override], [virtual]
```

Iterate the feedback loop once with an updated sensor value

**Parameters**

<i>val</i>	value from the sensor
------------	-----------------------

**Returns**

feedback loop result

Implements [Feedback](#).

The documentation for this class was generated from the following files:

- take\_back\_half.h
- take\_back\_half.cpp

## 5.89 TankDrive Class Reference

```
#include <tank_drive.h>
```

### Public Types

- enum class **BrakeType** { **None** , **ZeroVelocity** , **Smart** , **TurnOnly** }

### Public Member Functions

- **TankDrive** (motor\_group &left\_motors, motor\_group &right\_motors, **robot\_specs\_t** &config, **OdometryBase** \*odom=NULL)
- void **stop** ()
- **Pose2d get\_position** ()
- void **drive\_tank** (double left, double right, int power=1, **BrakeType** bt=**BrakeType::None**)
- void **drive\_tank\_raw** (double left, double right)
- void **drive\_arena** (double forward\_back, double left\_right, int power=1, **BrakeType** bt=**BrakeType::None**)
- bool **drive\_forward** (double inches, directionType dir, **Feedback** &feedback, double max\_speed=1, double end\_speed=0)
- bool **drive\_forward** (double inches, directionType dir, double max\_speed=1, double end\_speed=0)
- bool **turn\_degrees** (double degrees, **Feedback** &feedback, double max\_speed=1, double end\_speed=0)
- bool **turn\_degrees** (double degrees, double max\_speed=1, double end\_speed=0)
- bool **drive\_to\_point** (double x, double y, vex::directionType dir, **Feedback** &feedback, double max\_speed=1, double end\_speed=0)
- bool **drive\_to\_point** (double x, double y, vex::directionType dir, double max\_speed=1, double end\_speed=0)
- bool **turn\_to\_heading** (double heading\_deg, **Feedback** &feedback, double max\_speed=1, double end\_speed=0)
- bool **turn\_to\_heading** (double heading\_deg, double max\_speed=1, double end\_speed=0)
- void **reset\_auto** ()
- bool **pure\_pursuit** (**PurePursuit::Path** path, directionType dir, **Feedback** &feedback, double max\_speed=1, double end\_speed=0)

### Static Public Member Functions

- static double **modify\_inputs** (double input, int power=2)

#### 5.89.1 Detailed Description

**TankDrive** is a class to run a tank drive system. A tank drive system, sometimes called differential drive, has a motor (or group of synchronized motors) on the left and right side

#### 5.89.2 Member Enumeration Documentation

##### BrakeType

```
enum class TankDrive::BrakeType [strong]
```

**Enumerator**

None	just send 0 volts to the motors
ZeroVelocity	try to bring the robot to rest. But don't try to hold position
Smart	bring the robot to rest and once it's stopped, try to hold that position

**5.89.3 Constructor & Destructor Documentation****TankDrive()**

```
TankDrive::TankDrive (
    motor_group & left_motors,
    motor_group & right_motors,
    robot_specs_t & config,
    OdometryBase * odom = NULL)
```

Create the [TankDrive](#) Object

**Parameters**

<i>left_motors</i>	left side drive motors
<i>right_motors</i>	right side drive motors
<i>config</i>	the configuration specification defining physical dimensions about the robot. See <a href="#">robot_specs_t</a> for more info
<i>odom</i>	an odometry system to track position and rotation. this is necessary to execute autonomous paths

**5.89.4 Member Function Documentation****drive\_arcade()**

```
void TankDrive::drive_arcade (
    double forward_back,
    double left_right,
    int power = 1,
    BrakeType bt = BrakeType::None)
```

Drive the robot using arcade style controls. *forward\_back* controls the linear motion, *left\_right* controls the turning.

*forward\_back* and *left\_right* are in "percent": -1.0 -> 1.0

**Parameters**

<i>forward_back</i>	the percent to move forward or backward
<i>left_right</i>	the percent to turn left or right
<i>power</i>	modifies the input velocities left^power, right^power
<i>bt</i>	breaktype. What to do if the driver lets go of the sticks

Drive the robot using arcade style controls. *forward\_back* controls the linear motion, *left\_right* controls the turning.

*left\_motors* and *right\_motors* are in "percent": -1.0 -> 1.0

**drive\_forward() [1/2]**

```
bool TankDrive::drive_forward (
    double inches,
    directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

Autonomously drive the robot forward a certain distance

**Parameters**

<i>inches</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Autonomously drive the robot forward a certain distance

**Parameters**

<i>inches</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have finished driving to our point

**drive\_forward() [2/2]**

```
bool TankDrive::drive_forward (
    double inches,
    directionType dir,
    Feedback & feedback,
    double max_speed = 1,
    double end_speed = 0)
```

Use odometry to drive forward a certain distance using a custom feedback controller

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>inches</i>	the distance to drive forward
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the custom feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true when we have reached our target distance

Use odometry to drive forward a certain distance using a custom feedback controller

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>inches</i>	the distance to drive forward
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the custom feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**drive\_tank()**

```
void TankDrive::drive_tank (
    double left,
    double right,
    int power = 1,
    BrakeType bt = BrakeType::None)
```

Drive the robot using differential style controls. *left\_motors* controls the left motors, *right\_motors* controls the right motors.

*left\_motors* and *right\_motors* are in "percent": -1.0 -> 1.0

**Parameters**

<i>left</i>	the percent to run the left motors
<i>right</i>	the percent to run the right motors
<i>power</i>	modifies the input velocities <i>left</i> <sup><i>power</i></sup> , <i>right</i> <sup><i>power</i></sup>
<i>bt</i>	breaktype. What to do if the driver lets go of the sticks

**drive\_tank\_raw()**

```
void TankDrive::drive_tank_raw (
    double left,
    double right)
```

Drive the robot raw-ly

**Parameters**

<i>left</i>	the percent to run the left motors (-1, 1)
<i>right</i>	the percent to run the right motors (-1, 1)

**drive\_to\_point() [1/2]**

```
bool TankDrive::drive_to_point (
    double x,
    double y,
    vex::directionType dir,
    double max_speed = 1,
    double end_speed = 0)
```

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot. Here we use the default feedback controller from the *drive\_sys*

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot. Here we use the default feedback controller from the drive\_sys

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have reached our target point

**drive\_to\_point() [2/2]**

```
bool TankDrive::drive_to_point (
    double x,
    double y,
    vex::directionType dir,
    Feedback & feedback,
    double max_speed = 1,
    double end_speed = 0)
```

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot.

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Use odometry to automatically drive the robot to a point on the field. X and Y is the final point we want the robot.

Returns whether or not the robot has reached it's destination.

**Parameters**

<i>x</i>	the x position of the target
<i>y</i>	the y position of the target
<i>dir</i>	the direction we want to travel forward and backward
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have reached our target point

**get\_position()**

```
Pose2d TankDrive::get_position ()
```

Returns the Robot position as a [Pose2d](#)

**modify\_inputs()**

```
double TankDrive::modify_inputs (
    double input,
    int power = 2) [static]
```

Create a curve for the inputs, so that drivers have more control at lower speeds. Curves are exponential, with the default being squaring the inputs.

**Parameters**

<i>input</i>	the input before modification
<i>power</i>	the power to raise input to

**Returns**

*input*<sup>*power*</sup> (accounts for negative inputs and odd numbered powers)

Modify the inputs from the controller by squaring / cubing, etc Allows for better control of the robot at slower speeds

**Parameters**

<i>input</i>	the input signal -1 -> 1
<i>power</i>	the power to raise the signal to

**Returns**

*input*<sup>*power*</sup> accounting for any sign issues that would arise with this naive solution

**pure\_pursuit()**

```
bool TankDrive::pure_pursuit (
    PurePursuit::Path path,
    directionType dir,
    Feedback & feedback,
    double max_speed = 1,
    double end_speed = 0)
```

Drive the robot autonomously using a pure-pursuit algorithm - Input path with a set of waypoints - the robot will attempt to follow the points while cutting corners (radius) to save time (compared to stop / turn / start)

**Parameters**

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>feedback</i>	The feedback controller determining speed
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

True when the path is complete

Drive the robot autonomously using a pure-pursuit algorithm - Input path with a set of waypoints - the robot will attempt to follow the points while cutting corners (radius) to save time (compared to stop / turn / start)

**Parameters**

<i>path</i>	The list of coordinates to follow, in order
<i>dir</i>	Run the bot forwards or backwards
<i>feedback</i>	The feedback controller determining speed
<i>max_speed</i>	Limit the speed of the robot (for pid / pidff feedbacks)

**Returns**

True when the path is complete

**reset\_auto()**

```
void TankDrive::reset_auto ()
```

Reset the initialization for autonomous drive functions

**stop()**

```
void TankDrive::stop ()
```

Stops rotation of all the motors using their "brake mode"

**turn\_degrees()** [1/2]

```
bool TankDrive::turn_degrees (
    double degrees,
    double max_speed = 1,
    double end_speed = 0)
```

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent\_speed (-1.0 -> 1.0)

Uses the default turning feedback of the drive system.

**Parameters**

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent\_speed (-1.0 -> 1.0)

Uses the default turning feedback of the drive system.

**Parameters**

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we turned to target number of degrees

**turn\_degrees()** [2/2]

```
bool TankDrive::turn_degrees (
    double degrees,
    Feedback & feedback,
    double max_speed = 1,
    double end_speed = 0)
```

Autonomously turn the robot X degrees counterclockwise (negative for clockwise), with a maximum motor speed of percent\_speed (-1.0 -> 1.0)

Uses PID + Feedforward for it's control.

**Parameters**

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power

Autonomously turn the robot X degrees to counterclockwise (negative for clockwise), with a maximum motor speed of percent\_speed (-1.0 -> 1.0)

Uses the specified feedback for it's control.

**Parameters**

<i>degrees</i>	degrees by which we will turn relative to the robot (+) turns ccw, (-) turns cw
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have turned our target number of degrees

**turn\_to\_heading() [1/2]**

```
bool TankDrive::turn_to_heading (
    double heading_deg,
    double max_speed = 1,
    double end_speed = 0)
```

Turn the robot in place to an exact heading relative to the field. 0 is forward. Uses the defualt turn feedback of the drive system

**Parameters**

<i>heading_deg</i>	the heading to which we will turn
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Turn the robot in place to an exact heading relative to the field. 0 is forward. Uses the defualt turn feedback of the drive system

**Parameters**

<i>heading_deg</i>	the heading to which we will turn
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have reached our target heading

**turn\_to\_heading() [2/2]**

```
bool TankDrive::turn_to_heading (
    double heading_deg,
    Feedback & feedback,
    double max_speed = 1,
    double end_speed = 0)
```

Turn the robot in place to an exact heading relative to the field. 0 is forward.

**Parameters**

<i>heading_deg</i>	the heading to which we will turn
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

Turn the robot in place to an exact heading relative to the field. 0 is forward.

**Parameters**

<i>heading_deg</i>	the heading to which we will turn
<i>feedback</i>	the feedback controller we will use to travel. controls the rate at which we accelerate and drive.
<i>max_speed</i>	the maximum percentage of robot speed at which the robot will travel. 1 = full power
<i>end_speed</i>	the movement profile will attempt to reach this velocity by its completion

**Returns**

true if we have reached our target heading

## 5.92 tracking\_wheel\_cfg\_t Struct Reference

```
#include <odometry_nwheel.h>
```

### Public Attributes

- double x
- double y
- double theta\_rad
- double radius

#### 5.92.1 Detailed Description

##### OdometryNWheel

This class handles the code for an N-pod odometry setup, where there are N <WHEELS> free spinning omni wheels (dead wheels) placed in any known configuration on the robot.

Example of a possible wheel configuration:

```
+Y ----- ^ | ===| | | | | | O | | | | | | ==| | ----- | +-----> + X
```

Where O is the center of rotation. The robot will monitor the changes in rotation of these wheels, use this to calculate a pose delta, then integrate the deltas over time to determine the robot's position.

This is a "set and forget" class, meaning once the object is created, the robot will immediately begin tracking its movement in the background.

<https://rit.enterprise.slack.com/files/U04112Y5RB6/F080M01KPA5/predictperpindiculars2.pdf> 2024-2025 Notebook: Entries/Software Entries/Localization/N-Pod Odometry

#### Author

Jack Cammarata, Richie Sommers

#### Date

Nov 14 2024 [tracking\\_wheel\\_cfg\\_t](#) holds all the specifications for a single tracking wheel. The units for x, y, and radius will determine the units of the position estimate

### 5.92.2 Member Data Documentation

#### radius

```
double tracking_wheel_cfg_t::radius
```

radius of the wheel

#### theta\_rad

```
double tracking_wheel_cfg_t::theta_rad
```

angle between wheel direction and x axis in the robot frame

#### x

```
double tracking_wheel_cfg_t::x
```

x position of the center of the wheel

#### y

```
double tracking_wheel_cfg_t::y
```

y position of the center of the wheel

The documentation for this struct was generated from the following file:

- odometry\_nwheel.h

**5.93.1 Detailed Description**

Class representing a transformation of a pose2d, or a linear difference between the components of poses.

Assumes conventional cartesian coordinate system: Looking down at the coordinate plane, +X is right +Y is up  
+Theta is counterclockwise

**5.93.2 Constructor & Destructor Documentation****Transform2d() [1/7]**

```
Transform2d::Transform2d () [constexpr]
```

Default Constructor for [Transform2d](#)

**Transform2d() [2/7]**

```
Transform2d::Transform2d (
    const Translation2d & translation,
    const Rotation2d & rotation)
```

Constructs a transform given translation and rotation components.

**Parameters**

<i>translation</i>	the translational component of the transform.
<i>rotation</i>	the rotational component of the transform.

**Transform2d() [3/7]**

```
Transform2d::Transform2d (
    const double & x,
    const double & y,
    const Rotation2d & rotation)
```

Constructs a transform given translation and rotation components.

**Parameters**

<i>x</i>	the x component of the transform.
<i>y</i>	the y component of the transform.
<i>rotation</i>	the rotational component of the transform.

**Transform2d() [4/7]**

```
Transform2d::Transform2d (
    const double & x,
    const double & y,
    const double & radians)
```

Constructs a transform given translation and rotation components.

**Parameters**

<i>x</i>	the x component of the transform.
<i>y</i>	the y component of the transform.
<i>radians</i>	the rotational component of the transform in radians.

**Transform2d() [5/7]**

```
Transform2d::Transform2d (
    const Translation2d & translation,
    const double & radians)
```

Constructs a transform given translation and rotation components.

**Parameters**

<i>translation</i>	the translational component of the transform.
<i>radians</i>	the rotational component of the transform in radians.

**Transform2d() [6/7]**

```
Transform2d::Transform2d (
    const Eigen::Vector3d & transform_vector)
```

Constructs a transform given translation and rotation components given as a vector.

**Parameters**

<i>transform_vector</i>	vector of the form [x, y, theta]
-------------------------	----------------------------------

**Transform2d() [7/7]**

```
Transform2d::Transform2d (
    const Pose2d & start,
    const Pose2d & end)
```

Constructs a transform given translation and rotation components.

**Parameters**

<i>translation</i>	the translational component of the transform.
<i>rotation</i>	the rotational component of the transform.

### 5.93.3 Member Function Documentation

#### **inverse()**

```
Transform2d Transform2d::inverse () const
```

Inverts the transform.

##### Returns

the inverted transform.

#### **operator\*()**

```
Transform2d Transform2d::operator* (
    const double & scalar) const
```

Multiplies this transform by a scalar.

##### Parameters

<i>scalar</i>	the scalar to multiply this transform by.
---------------	---

#### **operator-()**

```
Transform2d Transform2d::operator- () const
```

Inverts the transform.

##### Returns

the inverted transform.

#### **operator/()**

```
Transform2d Transform2d::operator/ (
    const double & scalar) const
```

Divides this transform by a scalar.

##### Parameters

<i>scalar</i>	the scalar to divide this transform by.
---------------	---

#### **operator==( )**

```
bool Transform2d::operator== (
    const Transform2d & other) const
```

Compares this to another transform.

**Parameters**

<i>other</i>	the other transform to compare to.
--------------	------------------------------------

**Returns**

true if the components are within 1e-9 of each other.

**rotation()**

```
Rotation2d Transform2d::rotation () const
```

Returns the rotational component of the transform.

**Returns**

the rotational component of the transform.

**translation()**

```
Translation2d Transform2d::translation () const
```

Returns the translational component of the transform.

**Returns**

the translational component of the transform.

**x()**

```
double Transform2d::x () const
```

Returns the x component of the transform.

**Returns**

the x component of the transform.

**y()**

```
double Transform2d::y () const
```

Returns the y component of the transform.

**Returns**

the y component of the transform.

#### 5.93.4 Friends And Related Symbol Documentation

##### **operator<<**

```
std::ostream & operator<< (
    std::ostream & os,
    const Transform2d & transform) [friend]
```

Sends a transform to an output stream. Ex. std::cout << transform;

prints "Transform2d[dx: (value), dy: (value), drad: (radians), ddeg: (degrees)]"

Sends a transform to an output stream. Ex. std::cout << transform;

prints "Transform2d[x: (value), y: (value), rad: (radians), deg: (degrees)]"

The documentation for this class was generated from the following files:

### 5.94.1 Detailed Description

Class representing a point in 2d space with x and y coordinates.

Assumes conventional cartesian coordinate system: Looking down at the coordinate plane, +X is right +Y is up  
+Theta is counterclockwise

### 5.94.2 Constructor & Destructor Documentation

#### [Translation2d\(\)](#) [1/4]

```
Translation2d::Translation2d () [inline], [constexpr]
```

Default Constructor for [Translation2d](#)

#### [Translation2d\(\)](#) [2/4]

```
Translation2d::Translation2d (
    const double & x,
    const double & y)
```

Constructs a [Translation2d](#) with the given x and y values.

##### Parameters

x	The x component of the translation.
y	The y component of the translation.

#### [Translation2d\(\)](#) [3/4]

```
Translation2d::Translation2d (
    const Eigen::Vector2d & vector)
```

Constructs a [Translation2d](#) with the values from the given vector.

##### Parameters

vector	The vector whose values will be used.
--------	---------------------------------------

#### [Translation2d\(\)](#) [4/4]

```
Translation2d::Translation2d (
    const double & r,
    const Rotation2d & theta)
```

Constructs a [Translation2d](#) given polar coordinates of the form (r, theta).

**Parameters**

<i>r</i>	The radius (magnitude) of the vector.
<i>theta</i>	The angle (direction) of the vector.

**5.94.3 Member Function Documentation****as\_vector()**

```
Eigen::Vector2d Translation2d::as_vector () const
```

Returns the vector as an Eigen::Vector2d.

**Returns**

Eigen::Vector2d with the same values as the translation.

**distance()**

```
double Translation2d::distance (
    const Translation2d & other) const
```

Returns the distance between two translations.

**Returns**

the distance between two translations.

**norm()**

```
double Translation2d::norm () const
```

Returns the norm/radius/magnitude/distance from origin.

**Returns**

the norm of the translation.

**normalize()**

```
Translation2d Translation2d::normalize () const
```

returns a translation as if it were a vector with a magnitude of 1

**Returns**

the norm of the translation.

Returns a translation so that it has a vector magnitude of 1

**Returns**

the norm of the translation.

**operator\*() [1/2]**

```
Translation2d Translation2d::operator* (
    const double & scalar) const
```

Returns this translation multiplied by a scalar.

$[x] = [x] * [\text{scalar}]$   $[y] = [y] * [\text{scalar}]$

**Parameters**

<i>scalar</i>	the scalar to multiply by.
---------------	----------------------------

**Returns**

this translation multiplied by a scalar.

**operator\*() [2/2]**

```
double Translation2d::operator* (
    const Translation2d & other) const
```

Returns the dot product of two translations.

[scalar] = [x][otherx] + [y][othery]

**Parameters**

<i>other</i>	the other translation to find the dot product with.
--------------	---

**Returns**

the scalar valued dot product.

**operator+()**

```
Translation2d Translation2d::operator+ (
    const Translation2d & other) const
```

Returns the sum of two translations.

[x] = [x] + [otherx]; [y] = [y] + [othery];

**Parameters**

<i>other</i>	the other translation to add to this translation.
--------------	---

**Returns**

the sum of the two translations.

**operator-() [1/2]**

```
Translation2d Translation2d::operator- () const
```

Returns the inverse of this translation. Equivalent to flipping the vector across the origin.

[x] = [-x] [y] = [-y]

**Returns**

the inverse of this translation.

**operator-() [2/2]**

```
Translation2d Translation2d::operator- (
    const Translation2d & other) const
```

Returns the difference of two translations.

$[x] = [x] - [\text{other}x]$   $[y] = [y] - [\text{other}y]$

**Parameters**

<i>other</i>	the translation to subtract from this translation.
--------------	--

**Returns**

the difference of the two translations.

**operator/()**

```
Translation2d Translation2d::operator/ (
    const double & scalar) const
```

Returns this translation divided by a scalar.

$[x] = [x] / [\text{scalar}]$   $[y] = [y] / [\text{scalar}]$

**Parameters**

<i>scalar</i>	the scalar to divide by.
---------------	--------------------------

**Returns**

this translation divided by a scalar.

**operator==()**

```
bool Translation2d::operator== (
    const Translation2d & other) const
```

Compares two translations. Returns true if their components are each within 1e-9, to account for floating point error.

**Parameters**

<i>other</i>	the translation to compare to.
--------------	--------------------------------

**Returns**

whether the two translations are equal.

**rotate\_around()**

```
Translation2d Translation2d::rotate_around (
    const Translation2d & other,
    const Rotation2d & rotation) const
```

Applies a rotation to this translation around another given point.

$[x] = [\cos, -\sin][x - \text{other}x] + [\text{other}x]$   $[y] = [\sin, \cos][y - \text{other}y] + [\text{other}y]$

**Parameters**

<i>other</i>	the center of rotation.
<i>rotation</i>	the angle amount the translation will be rotated.

**Returns**

the translation that has been rotated.

**rotate\_by()**

```
Translation2d Translation2d::rotate_by (
    const Rotation2d & rotation) const
```

Applies a rotation to this translation around the origin.

Equivalent to multiplying a vector by a rotation matrix:  $x = [\cos, -\sin][x]$   $y = [\sin, \cos][y]$

**Parameters**

<i>rotation</i>	the angle amount the translation will be rotated.
-----------------	---

**Returns**

the new translation that has been rotated around the origin.

**setX()**

```
void Translation2d::setX (
    double x)
```

Sets the x value of the translation.

**setY()**

```
void Translation2d::setY (
    double y)
```

Sets the y value of the translation.

**theta()**

```
Rotation2d Translation2d::theta () const
```

Returns the angle of the translation.

**Returns**

the angle of the translation.

**x()**

```
double Translation2d::x () const
```

Returns the x value of the translation.

**Returns**

the x value of the translation.

**y()**

```
double Translation2d::y () const
```

Returns the y value of the translation.

**Returns**

the y value of the translation.

#### 5.94.4 Friends And Related Symbol Documentation

**operator<<**

```
std::ostream & operator<< (
    std::ostream & os,
    const Translation2d & translation) [friend]
```

Sends a translation to an output stream. Ex. std::cout << translation;

prints "Translation2d[x: (value), y: (value)]"

Sends a translation to an output stream. Ex. std::cout << translation;

prints "Translation2d[x: (value), y: (value), rad: (radians), deg: (degrees)]"

The documentation for this class was generated from the following files:

- translation2d.h
- translation2d.cpp

## 5.95 TrapezoidProfile Class Reference

```
#include <trapezoid_profile.h>
```

**Public Member Functions**

- [TrapezoidProfile](#) (const double &x\_initial, const double &x\_target, const double &v\_max, const double &accel, const double &decel)
- [motion\\_t calculate](#) (double t)
- [double total\\_time](#) ()

### 5.95.1 Detailed Description

Class representing a trapezoidal motion profile. This consists of either two or three stages. First, an acceleration stage where the velocity increases to a maximum. Then a cruise stage where the velocity is constant, then a deceleration stage where the velocity decreases to zero.

This implementation allows for different acceleration and deceleration rates.

This is best used with LQR, as it tracks both velocity and position at the same time, however it can also be used with [PID](#) and feedforward.

#### Author

Jack Cammarata

#### Date

3/28/2025

### 5.95.2 Constructor & Destructor Documentation

#### TrapezoidProfile()

```
TrapezoidProfile::TrapezoidProfile (
    const double & x_initial,
    const double & x_target,
    const double & v_max,
    const double & accel,
    const double & decel)
```

Constructs a [TrapezoidProfile](#).

#### Parameters

<i>x_initial</i>	The initial position.
<i>x_target</i>	The target position.
<i>v_max</i>	The maximum velocity.
<i>accel</i>	The acceleration.
<i>decel</i>	The deceleration.

### 5.95.3 Member Function Documentation

#### calculate()

```
motion_t TrapezoidProfile::calculate (
    double t)
```

Calculate the state along the motion profile at some given time.

**Parameters**

<i>t</i>	The time in seconds.
----------	----------------------

**Returns**

the state.

Calculate the state along the motion profile after some given time.

**Parameters**

<i>t</i>	The time in seconds.
----------	----------------------

**Returns**

the state.

**total\_time()**

```
double TrapezoidProfile::total_time ()
```

Returns the total time that the motion profile takes to complete.

**Returns**

the total time that the motion profile takes to complete.

The documentation for this class was generated from the following files:

- trapezoid\_profile.h
- trapezoid\_profile.cpp

## 5.96 TurnDegreesCommand Class Reference

```
#include <drive_commands.h>
```

### Public Member Functions

- [TurnDegreesCommand \(TankDrive &drive\\_sys, Feedback &feedback, double degrees, double max\\_speed=1, double end\\_speed=0\)](#)
- bool [run \(\) override](#)
- void [on\\_timeout \(\) override](#)

#### 5.96.1 Detailed Description

AutoCommand wrapper class for the turn\_degrees function in the [TankDrive](#) class

### 5.96.2 Constructor & Destructor Documentation

#### **TurnDegreesCommand()**

```
TurnDegreesCommand::TurnDegreesCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double degrees,
    double max_speed = 1,
    double end_speed = 0)
```

Construct a [TurnDegreesCommand](#) Command

#### Parameters

<i>drive_sys</i>	the drive system we are commanding
<i>feedback</i>	the feedback controller we are using to execute the turn
<i>degrees</i>	how many degrees to rotate
<i>max_speed</i>	0 -> 1 percentage of the drive systems speed to drive at

### 5.96.3 Member Function Documentation

#### **on\_timeout()**

```
void TurnDegreesCommand::on_timeout () [override]
```

Cleans up drive system if we time out before finishing

reset the drive system if we timeout

#### **run()**

```
bool TurnDegreesCommand::run () [override]
```

Run turn\_degrees Overrides run from AutoCommand

#### Returns

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- drive\_commands.h
- drive\_commands.cpp

## 5.97 TurnToHeadingCommand Class Reference

```
#include <drive_commands.h>
```

## Public Member Functions

- `TurnToHeadingCommand (TankDrive &drive_sys, Feedback &feedback, double heading_deg, double speed=1, double end_speed=0)`
- `bool run () override`
- `void on_timeout () override`

### 5.97.1 Detailed Description

AutoCommand wrapper class for the turn\_to\_heading() function in the `TankDrive` class

### 5.97.2 Constructor & Destructor Documentation

#### `TurnToHeadingCommand()`

```
TurnToHeadingCommand::TurnToHeadingCommand (
    TankDrive & drive_sys,
    Feedback & feedback,
    double heading_deg,
    double max_speed = 1,
    double end_speed = 0)
```

Construct a `TurnToHeadingCommand` Command

##### Parameters

<code>drive_sys</code>	the drive system we are commanding
<code>feedback</code>	the feedback controller we are using to execute the drive
<code>heading_deg</code>	the heading to turn to in degrees
<code>max_speed</code>	0 -> 1 percentage of the drive systems speed to drive at

### 5.97.3 Member Function Documentation

#### `on_timeout()`

```
void TurnToHeadingCommand::on_timeout () [override]
```

Cleans up drive system if we time out before finishing

reset the drive system if we don't hit our target

#### `run()`

```
bool TurnToHeadingCommand::run () [override]
```

Run turn\_to\_heading Overrides run from AutoCommand

##### Returns

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- `drive_commands.h`
- `drive_commands.cpp`

## 5.98 Twist2d Class Reference

```

- `Twist2d operator/ (const double &scalar) const`

### Friends

- `std::ostream & operator<< (std::ostream &os, const Twist2d &twist)`

### 5.98.1 Detailed Description

Class representing a difference between two poses, more specifically a distance along an arc from a pose.

Assumes conventional cartesian coordinate system: Looking down at the coordinate plane, +X is right +Y is up  
+Theta is counterclockwise

### 5.98.2 Constructor & Destructor Documentation

#### Twist2d() [1/3]

```
Twist2d::Twist2d () [constexpr]
```

Default Constructor for `Twist2d`

#### Twist2d() [2/3]

```
Twist2d::Twist2d (
    const double & dx,
    const double & dy,
    const double & dtheta)
```

Constructs a twist with given translation and angle deltas.

#### Parameters

<code>dx</code>	the linear dx component.
<code>dy</code>	the linear dy component.
<code>dtheta</code>	the angular dtheta component.

#### Twist2d() [3/3]

```
Twist2d::Twist2d (
    const Eigen::Vector3d & twist_vector)
```

Constructs a twist with given translation and angle deltas.

**Parameters**

<i>twist_vector</i>	vector of the form [dx, dy, dtheta]
---------------------	-------------------------------------

**5.98.3 Member Function Documentation****dtheta()**

```
double Twist2d::dtheta () const
```

Returns the angular dtheta component.

**Returns**

the angular dtheta component.

**dx()**

```
double Twist2d::dx () const
```

Returns the linear dx component.

**Returns**

the linear dx component.

**dy()**

```
double Twist2d::dy () const
```

Returns the linear dy component.

**Returns**

the linear dy component.

**operator\*()**

```
Twist2d Twist2d::operator* (
    const double & scalar) const
```

Multiplies this twist by a scalar.

**Parameters**

<i>scalar</i>	the scalar value to multiply by.
---------------	----------------------------------

**operator/()**

```
Twist2d Twist2d::operator/ (
    const double & scalar) const
```

Divides this twist by a scalar.

**Parameters**

<i>scalar</i>	the scalar value to divide by.
---------------	--------------------------------

**operator==()**

```
bool Twist2d::operator== (
    const Twist2d & other) const
```

Compares this to another twist.

**Parameters**

<i>other</i>	the other twist to compare to.
--------------	--------------------------------

**Returns**

true if each of the components are within 1e-9 of each other.

**5.98.4 Friends And Related Symbol Documentation****operator<<**

```
std::ostream & operator<< (
    std::ostream & os,
    const Twist2d & twist) [friend]
```

Sends a twist to an output stream. Ex. std::cout << twist;

prints "Twist2d[dx: (value), dy: (value), drad: (radians)]"

Sends a twist to an output stream. Ex. std::cout << twist;

prints "Twist2d[x: (value), y: (value), rad: (radians), deg: (degrees)]"

The documentation for this class was generated from the following files:

- twist2d.h
- twist2d.cpp

### 5.99.1 Detailed Description

```
template<int STATES, int INPUTS, int OUTPUTS>
class UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >
```

Kalman filters combine predictions from a model and measurements to estimate a system's true state.

The Unscented Kalman Filter is a nonlinear estimator, meaning that the model used to predict how the state changes over time can be nonlinear. The model that determines the expected measurement given the current state can also be nonlinear.

At each timestep, sigma points are generated close to the mean, they are all propagated forward in time according to the nonlinear model. The Unscented Transform uses the propagated sigma points to compute the prior state and covariance.

When correcting the state and covariance with a measurement, sigma points are again generated, but are transformed into the measurement space using the measurement function. A Kalman gain matrix K is then computed, and used to update the state and covariance.

To read more about Kalman filters and the standard UKF read: <https://github.com/rlabbe/Kalman-and-Bayesian-Filters-in-Python>

This implementation is somewhat non-standard. The square-root form of the UKF (SR-UKF) is used, and the way the sigma points are generated is different than most implementations. The square-root form is used to ensure that the covariance matrix remains positive definite.

To learn more about the SR-UKF, and see the exact formulation that most of this implementation follows, read: <https://www.researchgate.net/publication/3908304>

The sigma points are not generated symmetrically around the mean, instead they are generated as vertices of a simplex. Using  $N = \# \text{ of states}$ , this method uses  $N + 2$  sigma points instead of the standard  $2N + 1$  sigma points. This reduces computation up to 50%. To learn more about this method, read: <https://www.sciencedirect.com/science/article/pii/S0888327020308190>

This filter uses a method of "recalibrating" by essentially applying a measurement twice instead of once, and only using it if it is more accurate than before the measurement was applied. To learn more about this framework for nonlinear filters, read: <https://arxiv.org/pdf/2407.05717.pdf>

#### Template Parameters

<i>STATES</i>	Dimension of the state vector.
<i>INPUTS</i>	Dimension of the control input vector.
<i>OUTPUTS</i>	Dimension of the measurement vector.

#### 5.99.2 Constructor & Destructor Documentation

##### UnscentedKalmanFilter() [1/2]

```
template<int STATES, int INPUTS, int OUTPUTS>
UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::UnscentedKalmanFilter (
    const std::function< StateVector(const StateVector &, const InputVector &) > & f,
    const std::function< OutputVector(const StateVector &, const InputVector &) > & h,
    const WithInputIntegrator & integrator,
    const StateVector & state_stddevs,
    const OutputVector & measurement_stddevs) [inline]
```

Constructs an Unscented Kalman Filter.

#### Parameters

<i>f</i>	A vector valued function of $x$ and $u$ that returns the derivative of the state vector with respect to time.
<i>h</i>	A vector valued function of $x$ and $u$ that returns the expected measurement at the given state.
<i>integrator</i>	A function from "numerical_integration.h" that integrates a differential equation of the form $f(x, u)$ .
<i>state_stddevs</i>	Standard deviations of the states in the model.
<i>measurement_stddevs</i>	Standard deviations of the measurements.

**UnscentedKalmanFilter() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::UnscentedKalmanFilter (
    const std::function< StateVector(const StateVector &, const InputVector &) > & f,
    const std::function< OutputVector(const StateVector &, const InputVector &) > & h,
    const WithInputIntegrator & integrator,
    const StateVector & state_stddevs,
    const OutputVector & measurement_stddevs,
    const std::function< StateVector(const EMat< STATES, NUM_SIGMAS > &, const EVec<
NUM_SIGMAS > &) > & mean_func_X,
    const std::function< OutputVector(const EMat< OUTPUTS, NUM_SIGMAS > &, const
EVec< NUM_SIGMAS > &) > & mean_func_Y,
    const std::function< StateVector(const StateVector &, const StateVector &) > &
residual_func_X,
    const std::function< OutputVector(const OutputVector &, const OutputVector &) > &
residual_func_Y,
    const std::function< StateVector(const StateVector &, const StateVector &) > &
add_func_X) [inline]
```

Constructs an Unscented Kalman Filter with custom mean, residual, and addition functions. The most common use for these functions is when you are estimating angles whose arithmetic operations need to be wrapped.

**Parameters**

<i>f</i>	A vector valued function of <i>x</i> and <i>u</i> that returns the derivative of the state vector with respect to time.
<i>h</i>	A vector valued function of <i>x</i> and <i>u</i> that returns the expected measurement at the given state.
<i>integrator</i>	A function from "numerical_integration.h" that integrates a differential equation of the form <i>f(x, u)</i> .
<i>state_stddevs</i>	Standard deviations of the states in the model.
<i>measurement_stddevs</i>	Standard deviations of the measurements.
<i>mean_func_X</i>	A function that computes the mean of a matrix containing NUM_SIGMAS state sigma points with a set of weights for each.
<i>mean_func_Y</i>	A function that computes the mean of a matrix containing NUM_SIGMAS measurement sigma points with a set of weights for each.
<i>residual_func_X</i>	A function that computes the residual of two state vectors, usually by simple subtraction.
<i>residual_func_Y</i>	A function that computes the residual of two measurement vectors, usually by simple subtraction.
<i>add_func_X</i>	A function that adds two state vectors.

**5.99.3 Member Function Documentation****correct() [1/4]**

```
template<int STATES, int INPUTS, int OUTPUTS>
template<int ROWS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const InputVector & u,
    const EVec< ROWS > & y,
    const std::function< EVec< ROWS >(const StateVector &, const InputVector &) > &
```

```
h,
    const EVec< ROWS > & measurement_stddevs) [inline]
```

Correct the state estimate using the measurements in y, a custom measurement function, and custom standard deviations. This is useful for when a different set of measurements are being applied.

#### Parameters

<i>u</i>	The control input used in the last predict step.
<i>y</i>	The vector of measurements.
<i>h</i>	A vector valued function of x and u that returns the expected measurement at the given state.
<i>measurement_stddevs</i>	The vector of standard deviations for each measurement to be used for this correct step.

#### correct() [2/4]

```
template<int STATES, int INPUTS, int OUTPUTS>
template<int ROWS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const InputVector & u,
    const EVec< ROWS > & y,
    const std::function< EVec< ROWS >(const StateVector &, const InputVector &) > &
h,
    const EVec< ROWS > measurement_stddevs,
    const std::function< EVec< ROWS >(const EMat< ROWS, NUM_SIGMAS > &, const EVec< NUM_SIGMAS > &) > & mean_func_Y,
    const std::function< EVec< ROWS >(const EVec< ROWS > &, const EVec< ROWS > &) > & residual_func_Y,
    const std::function< StateVector(const StateVector &, const StateVector &) > & residual_func_X,
    const std::function< StateVector(const StateVector &, const StateVector &) > & add_func_X) [inline]
```

Correct the state estimate using the measurements in y, a custom measurement function, custom standard deviations, and custom mean, residual, and addition functions. This is useful for when a different set of measurements are being applied, and they require custom arithmetic functions.

#### Parameters

<i>u</i>	The control input used in the last predict step.
<i>y</i>	The vector of measurements.
<i>h</i>	A vector valued function of x and u that returns the expected measurement at the given state.
<i>measurement_stddevs</i>	The vector of standard deviations for each measurement to be used for this correct step.
<i>mean_func_Y</i>	A function that computes the mean of a matrix containing NUM_SIGMAS measurement sigma points with a set of weights for each.
<i>residual_func_X</i>	A function that computes the residual of two state vectors, usually by simple subtraction.
<i>residual_func_Y</i>	A function that computes the residual of two measurement vectors, usually by simple subtraction.
<i>add_func_X</i>	A function that adds two state vectors.

**correct() [3/4]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const InputVector & u,
    const OutputVector & y)  [inline]
```

Correct the state estimate using the measurements in y.

**Parameters**

<i>u</i>	The control input used in the last predict step.
<i>y</i>	The vector of measurements.

**correct() [4/4]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::correct (
    const InputVector & u,
    const OutputVector & y,
    const EVec< OUTPUTS > & measurement_stddevs)  [inline]
```

Correct the state estimate using the measurements in y, and custom standard deviations. This is useful for when the noise in the measurements vary.

**Parameters**

<i>u</i>	The control input used in the last predict step.
<i>y</i>	The vector of measurements.
<i>measurement_stddevs</i>	The vector of standard deviations for each measurement to be used for this correct step.

**P()**

```
template<int STATES, int INPUTS, int OUTPUTS>
StateMatrix UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::P () const [inline]
```

Returns the reconstructed covariance matrix P.

**predict()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::predict (
    const InputVector & u,
    double dt)  [inline]
```

Projects the state into the future by dt seconds with control input u.

**Parameters**

<i>u</i>	The control input.
<i>dt</i>	The timestep in seconds.

**reset()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::reset () [inline]
```

Resets the filter.

**S() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
StateMatrix UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::S () const [inline]
```

Returns the square-root covariance matrix S.

**S() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
double UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::S (
    int i,
    int j) const [inline]
```

Returns one element of the square-root covariance matrix S.

**Parameters**

<i>i</i>	Row of S.
<i>j</i>	Column of S.

**set\_P()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::set_P (
    const StateMatrix & P) [inline]
```

Set the current square-root covariance matrix S to the square-root of P.

**Parameters**

<i>P</i>	The covariance matrix P.
----------	--------------------------

**set\_S()**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::set_S (
    const StateMatrix & S) [inline]
```

Set the current square-root covariance matrix S.

**Parameters**

<b>S</b>	The new square-root covariance matrix S.
----------	--

**set\_xhat() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::set_xhat (
    const StateVector & xhat) [inline]
```

Set the current state estimate x-hat.

**set\_xhat() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
void UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::set_xhat (
    int i,
    double value) [inline]
```

Set one element of the current state estimate x-hat.

**Parameters**

<b>i</b>	Row of x-hat.
----------	---------------

**xhat() [1/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
StateVector UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::xhat () const [inline]
```

Returns the current state estimate x-hat.

**xhat() [2/2]**

```
template<int STATES, int INPUTS, int OUTPUTS>
double UnscentedKalmanFilter< STATES, INPUTS, OUTPUTS >::xhat (
    int i) const [inline]
```

Returns one element of the current state estimate x-hat.

**Parameters**

<b>i</b>	Row of x-hat.
----------	---------------

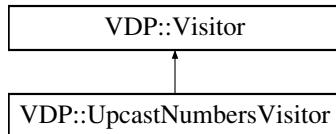

The documentation for this class was generated from the following file:

- unscented\_kalman\_filter.h

## 5.100 VDP::UpcastNumbersVisitor Class Reference

```
#include <types.hpp>
```

Inheritance diagram for VDP::UpcastNumbersVisitor:

### 5.100.1 Detailed Description

A class for broadly visiting a part and doing some action based on the upcast type of the part

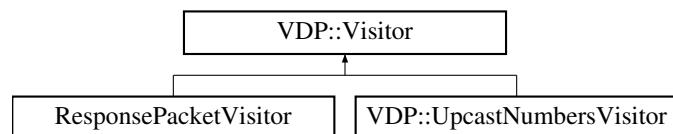

The documentation for this class was generated from the following files:

- types.hpp
- types.cpp

## 5.101 VDP::Visitor Class Reference

```
#include <types.hpp>
```

Inheritance diagram for VDP::Visitor:

### 5.101.1 Detailed Description

A class for broadly visiting a part and doing some action based on the type of part

The documentation for this class was generated from the following file:

- types.hpp

## 5.102 WaitUntilCondition Class Reference

Waits until the condition is true.

```
#include <auto_command.h>
```

### 5.102.1 Detailed Description

Waits until the condition is true.

The documentation for this class was generated from the following file:

- auto\_command.h

## 5.103 WaitUntilUpToSpeedCommand Class Reference

```
#include <flywheel_commands.h>
```

### Public Member Functions

- [WaitUntilUpToSpeedCommand](#) (*Flywheel* &*flywheel*, int *threshold\_rpm*)
- bool [run \(\)](#) override

### 5.103.1 Detailed Description

AutoCommand that listens to the [Flywheel](#) and waits until it is at its target speed +/- the specified threshold

### 5.103.2 Constructor & Destructor Documentation

#### [WaitUntilUpToSpeedCommand\(\)](#)

```
WaitUntilUpToSpeedCommand::WaitUntilUpToSpeedCommand (
```

<pre>    Flywheel &amp; flywheel,</pre>	
	<pre>    int threshold_rpm)</pre>

Create a [WaitUntilUpToSpeedCommand](#)

#### Parameters

<i>flywheel</i>	the flywheel system we are commanding
<i>threshold_rpm</i>	the threshold over and under the flywheel target RPM that we define to be acceptable

### 5.103.3 Member Function Documentation

#### [run\(\)](#)

```
bool WaitUntilUpToSpeedCommand::run () [override]
```

Run spin\_manual Overrides run from AutoCommand

#### Returns

true when execution is complete, false otherwise

The documentation for this class was generated from the following files:

- *flywheel\_commands.h*
- *flywheel\_commands.cpp*
